Highway Segment	Collision with Fixed Object	7.81	6.8	20.88	18.1	28.69	24.9
Highway Segment	Collision with Other Object	0.55	0.5	4.05	3.5	4.61	4.0
Highway Segment	Other Single-vehicle Collision	2.25	2.0	3.12	2.7	5.37	4.7
Highway Segment	Collision with Parked Vehicle	0.16	0.1	0.47	0.4	0.63	0.5
Highway Segment	Total Single Vehicle Crashes	10.82	9.4	29.16	25.3	39.98	34.7
Highway Segment	Right-Angle Collision	0.66	0.6	0.97	0.8	1.63	1.4
Highway Segment	Head-on Collision	0.17	0.1	0.11	0.1	0.28	0.2
Highway Segment	Other Multi-vehicle Collision	0.66	0.6	1.30	1.1	1.95	1.7
Highway Segment	Rear-end Collision	15.86	13.8	37.29	32.4	53.14	46.1
Highway Segment	Sideswipe, Same Direction Collision	3.81	3.3	14.37	12.5	18.18	15.8
Highway Segment	Total Multiple Vehicle Crashes	21.14	18.4	54.04	46.9	75.18	65.3
Highway Segment	Total Highway Segment Crashes	31.96	27.8	83.19	72.2	115.16	100.0
	Total Crashes	31.96	27.8	83.19	72.2	115.16	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 8. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1000+00.000	1019+50.000	Information: for segment #1 (1000+00.000 to 1019+50.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1019+50.000	Information: for segment #1 (1000+00.000 to 1019+50.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1019+50.000	Information: for segment #1 (1000+00.000 to 1019+50.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1019+50.000	Information: for segment #1 (1000+00.000 to 1019+50.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+50.000	1020+63.580	Information: for segment #2 (1019+50.000 to 1020+63.580), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+50.000	1020+63.580	Information: for segment #2 (1019+50.000 to 1020+63.580), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+50.000	1020+63.580	Information: for segment #2 (1019+50.000 to 1020+63.580), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+50.000	1020+63.580	Information: for segment #2 (1019+50.000 to 1020+63.580), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+98.000	Information: for segment #3 (1020+63.580 to 1022+98.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+98.000	Information: for segment #3 (1020+63.580 to 1022+98.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+98.000	Information: for segment #3 (1020+63.580 to 1022+98.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+98.000	Information: for segment #3 (1020+63.580 to 1022+98.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+98.000	1023+61.570	Information: for segment #4 (1022+98.000 to 1023+61.570), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+98.000	1023+61.570	Information: for segment #4 (1022+98.000 to 1023+61.570), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+98.000	1023+61.570	Information: for segment #4 (1022+98.000 to 1023+61.570), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+98.000	1023+61.570	Information: for segment #4 (1022+98.000 to 1023+61.570), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+45.000	Information: for segment #5 (1023+61.570 to 1026+45.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+45.000	Information: for segment #5 (1023+61.570 to 1026+45.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+45.000	Information: for segment #5 (1023+61.570 to 1026+45.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+45.000	Information: for segment #5 (1023+61.570 to 1026+45.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1026+45.000	1029+93.000	Information: for segment #6 (1026+45.000 to 1029+93.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1026+45.000	1029+93.000	Information: for segment #6 (1026+45.000 to 1029+93.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1026+45.000	1029+93.000	Information: for segment #6 (1026+45.000 to 1029+93.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1026+45.000	1029+93.000	Information: for segment #6 (1026+45.000 to 1029+93.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1029+93.000	1033+41.000	Information: for segment #7 (1029+93.000 to 1033+41.000), Effective median width (94.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1029+93.000	1033+41.000	Information: for segment #7 (1029+93.000 to 1033+41.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1029+93.000	1033+41.000	Information: for segment #7 (1029+93.000 to 1033+41.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1029+93.000	1033+41.000	Information: for segment #7 (1029+93.000 to 1033+41.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1029+93.000	1033+41.000	Information: for segment #7 (1029+93.000 to 1033+41.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1033+41.000	1037+33.000	Information: for segment #8 (1033+41.000 to 1037+33.000), Effective median width (93.98 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1033+41.000	1037+33.000	Information: for segment #8 (1033+41.000 to 1037+33.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1033+41.000	1037+33.000	Information: for segment #8 (1033+41.000 to 1037+33.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1033+41.000	1037+33.000	Information: for segment #8 (1033+41.000 to 1037+33.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1033+41.000	1037+33.000	Information: for segment #8 (1033+41.000 to 1037+33.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1037+33.000	1038+65.500	Information: for segment #9 (1037+33.000 to 1038+65.500), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1037+33.000	1038+65.500	Information: for segment #9 (1037+33.000 to 1038+65.500), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1037+33.000	1038+65.500	Information: for segment #9 (1037+33.000 to 1038+65.500), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1037+33.000	1038+65.500	Information: for segment #9 (1037+33.000 to 1038+65.500), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+65.500	1039+48.030	Information: for segment #10 (1038+65.500 to 1039+48.030), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+65.500	1039+48.030	Information: for segment #10 (1038+65.500 to 1039+48.030), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+65.500	1039+48.030	Information: for segment #10 (1038+65.500 to 1039+48.030), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+65.500	1039+48.030	Information: for segment #10 (1038+65.500 to 1039+48.030), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1039+48.030	1041+26.000	Information: for segment #11 (1039+48.030 to 1041+26.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1039+48.030	1041+26.000	Information: for segment #11 (1039+48.030 to 1041+26.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1039+48.030	1041+26.000	Information: for segment #11 (1039+48.030 to 1041+26.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1039+48.030	1041+26.000	Information: for segment #11 (1039+48.030 to 1041+26.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1084+27.000	1085+37.030	Information: for segment #19 (1084+27.000 to 1085+37.030), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1085+37.030	1086+14.425	Information: for segment #20 (1085+37.030 to 1086+14.425), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1085+37.030	1086+14.425	Information: for segment #20 (1085+37.030 to 1086+14.425), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1085+37.030	1086+14.425	Information: for segment #20 (1085+37.030 to 1086+14.425), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1085+37.030	1086+14.425	Information: for segment #20 (1085+37.030 to 1086+14.425), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+98.000	Information: for segment #3 (1020+63.580 to 1022+98.000), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1022+98.000	1023+61.570	Information: for segment #4 (1022+98.000 to 1023+61.570), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1038+65.500	1039+48.030	Information: for segment #10 (1038+65.500 to 1039+48.030), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 2
Evaluation Comment: Created Thu Jun 23 11:57:01 CDT 2022

Minimum Location: 1137+96.210
Maximum Location: 1160+88.270

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1137+96.210
Evaluation End Location: 1160+88.270
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

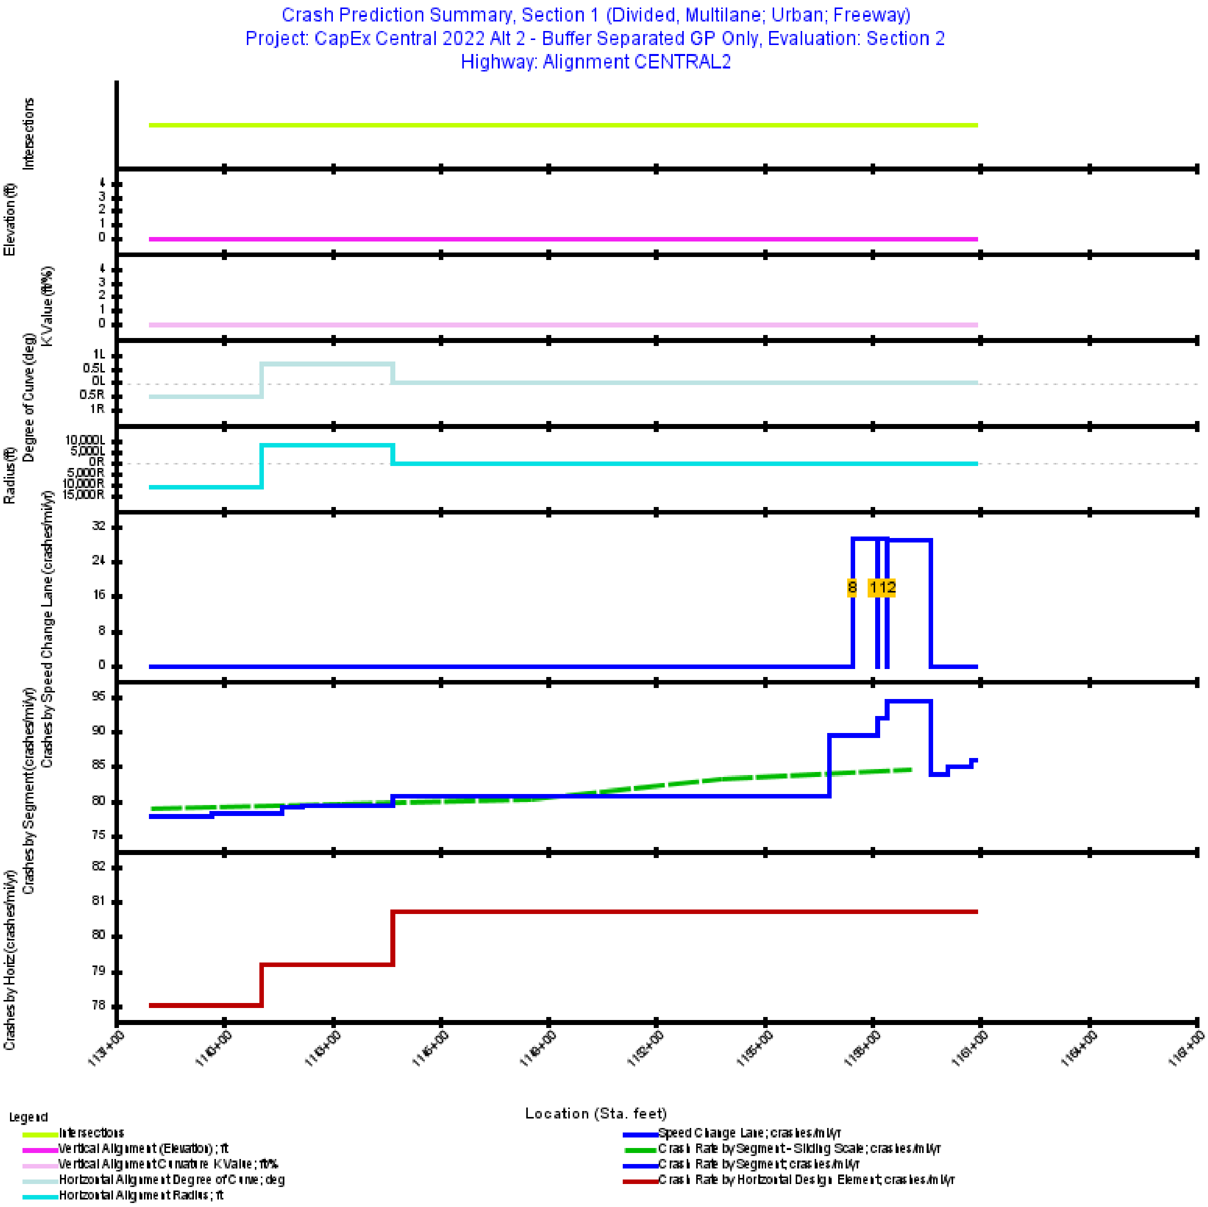

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1137+96.210	1138+94.210	98.00	0.0186	2030: 216,900	66.00	Non-Traversable Median	73.18
2	Ten-lane Freeway	Urban	1138+94.210	1139+65.400	71.19	0.0135	2030: 216,900	66.00	Non-Traversable Median	72.86
3	Ten-lane Freeway	Urban	1139+65.400	1141+60.170	194.77	0.0369	2030: 216,900	66.00	Non-Traversable Median	71.98
4	Ten-lane Freeway	Urban	1141+60.170	1142+18.210	58.04	0.0110	2030: 216,900	66.00	Non-Traversable Median	71.11
5	Ten-lane Freeway	Urban	1142+18.210	1144+70.090	251.88	0.0477	2030: 216,900	66.00	Non-Traversable Median	70.50
6	Ten-lane Freeway	Urban	1144+70.090	1156+78.710	1,208.62	0.2289	2030: 216,900	66.00	Non-Traversable Median	70.00
7	Ten-lane Freeway	Urban	1156+78.710	1158+15.730	137.02	0.0260	2030: 216,900	66.00	Non-Traversable Median	70.35
9	Ten-lane Freeway	Urban	1158+15.730	1158+42.210	26.48	0.0050	2030: 216,900	66.00	Non-Traversable Median	70.85
11	Ten-lane Freeway	Urban	1158+42.210	1159+61.730	119.52	0.0226	2030: 216,900	66.00	Non-Traversable Median	71.73
13	Nine-lane Freeway	Urban	1159+61.730	1160+08.210	46.48	0.0088	2030: 200,650	66.00	Non-Traversable Median	72.73
14	Nine-lane Freeway	Urban	1160+08.210	1160+75.280	67.07	0.0127	2030: 200,650	66.00	Non-Traversable Median	73.41
15	Nine-lane Freeway	Urban	1160+75.280	1160+88.270	12.99	0.0025	2030: 200,650	66.00	Non-Traversable Median	73.86

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
8	Ten-lane Freeway Speed Change	Exit	1157+46.730	1158+15.730	69.00	0.0131	2030: 216,900	66.00	Non-Traversable Median	70.52
10	Ten-lane Freeway Speed Change	Exit	1158+15.730	1158+42.210	26.48	0.0050	2030: 216,900	66.00	Non-Traversable Median	70.85
12	Ten-lane Freeway Speed Change	Exit	1158+42.210	1159+61.730	119.52	0.0226	2030: 216,900	66.00	Non-Traversable Median	71.73

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.4137**
Average Future Road AADT (vpd)	**215,959**
Predicted Crashes	
Total Crashes	**33.59**
Fatal and Injury Crashes	**9.29**
Property-Damage-Only Crashes	**24.29**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**81.1726**
FI Crash Rate (crashes/mi/yr)	**22.4628**
PDO Crash Rate (crashes/mi/yr)	**58.7098**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**32.61**
Travel Crash Rate (crashes/million veh-mi)	**1.03**
Travel FI Crash Rate (crashes/million veh-mi)	**0.28**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.74**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0407**
Average Future Road AADT (vpd)	**108,450**
Predicted Crashes	
Total Crashes	**1.19**
Fatal and Injury Crashes	**0.39**
Property-Damage-Only Crashes	**0.80**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**32**
Percent Property-Damage-Only Crashes (%)	**68**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**29.2018**
FI Crash Rate (crashes/mi/yr)	**9.4735**
PDO Crash Rate (crashes/mi/yr)	**19.7282**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**1.61**
Travel Crash Rate (crashes/million veh-mi)	**0.74**
Travel FI Crash Rate (crashes/million veh-mi)	**0.24**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.50**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1137+96.210	1138+94.210	0.0186	1.446	1.4456	0.3988	1.0468	77.8843	0.98
2	1138+94.210	1139+65.400	0.0135	1.049	1.0491	0.2894	0.7597	77.8079	0.98
3	1139+65.400	1141+60.170	0.0369	2.887	2.8868	0.7964	2.0905	78.2591	0.99
4	1141+60.170	1142+18.210	0.0110	0.869	0.8694	0.2398	0.6297	79.0952	1.00
5	1142+18.210	1144+70.090	0.0477	3.788	3.7882	1.0451	2.7430	79.4088	1.00
6	1144+70.090	1156+78.710	0.2289	18.480	18.4797	5.1244	13.3553	80.7306	1.02
7	1156+78.710	1158+15.730	0.0194	1.739	1.7387	0.4831	1.2556	89.5462	1.13
9	1158+15.730	1158+42.210	0.0025	0.231	0.2305	0.0640	0.1665	91.9239	1.16
11	1158+42.210	1159+61.730	0.0113	1.068	1.0679	0.2961	0.7718	94.3550	1.19
13	1159+61.730	1160+08.210	0.0088	0.738	0.7382	0.2027	0.5355	83.8555	1.15
14	1160+08.210	1160+75.280	0.0127	1.079	1.0792	0.2961	0.7831	84.9580	1.16
15	1160+75.280	1160+88.270	0.0025	0.211	0.2113	0.0579	0.1533	85.8697	1.17
Total			0.4137	33.584	33.5845	9.2938	24.2907	81.1726	1.03

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 6. Predicted Crash Frequencies and Rates by Freeway Speed Change Lane (Speed Change)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
8	1157+46.730	1158+15.730	0.0131	0.384	0.3838	0.1246	0.2592	29.3682	0.74
10	1158+15.730	1158+42.210	0.0050	0.147	0.1469	0.0477	0.0992	29.2904	0.74
12	1158+42.210	1159+61.730	0.0226	0.658	0.6584	0.2135	0.4449	29.0861	0.73
Total			0.0407	1.189	1.1891	0.3858	0.8033	29.2018	0.74

Note: *Travel Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 7. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
Simple Curve 1	1137+96.210	1141+05.636	0.0586	4.573	4.5732	1.2616	3.3117	78.0366	0.99
Simple Curve 2	1141+05.636	1144+70.088	0.0690	5.466	5.4659	1.5079	3.9580	79.1868	1.00
Tangent	1144+70.088	1160+88.270	0.3065	24.735	24.7345	6.9101	17.8244	80.7069	1.15

Table 8. Predicted Crash Frequencies by Year (Section 1)

Year	Total Crashes	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)
2030	34.77	9.68	27.836	25.09	72.164
Total	34.77	9.68	27.836	25.09	72.164
Average	34.77	9.68	27.836	25.09	72.164

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 9. Predicted Crash Severity by Freeway Segment (Section 1)

Seg. No.	Fatal (K) Crashes (crashes)	Incapacitating Injury (A) Crashes (crashes)	Non-Incapacitating Injury (B) Crashes (crashes)	Possible Injury (C) Crashes (crashes)	No Injury (O) Crashes (crashes)
1	0.0094	0.0198	0.1347	0.2349	1.0468

Highway Segment	Total Highway Segment Crashes	9.29	27.7	24.29	72.3	33.59	100.0
	Total Crashes	9.29	27.7	24.29	72.3	33.59	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 12. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.01	0.5	0.01	0.5
Highway Segment	Collision with Fixed Object	0.08	6.4	0.17	14.0	0.24	20.3
Highway Segment	Collision with Other Object	0.01	0.5	0.02	2.0	0.03	2.5
Highway Segment	Other Single-vehicle Collision	0.02	1.6	0.02	1.6	0.04	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.10	8.5	0.21	18.0	0.32	26.5
Highway Segment	Right-Angle Collision	0.00	0.4	0.01	0.8	0.01	1.2
Highway Segment	Head-on Collision	0.00	0.2	0.00	0.1	0.00	0.3
Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.01	1.1	0.02	1.6
Highway Segment	Rear-end Collision	0.21	17.8	0.45	38.2	0.67	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.06	5.1	0.11	9.3	0.17	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.28	24.0	0.59	49.5	0.87	73.5
Highway Segment	Total Highway Segment Crashes	0.39	32.4	0.80	67.6	1.19	100.0
	Total Crashes	0.39	32.4	0.80	67.6	1.19	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1137+96.210	1138+94.210	Information: for segment #1 (1137+96.210 to 1138+94.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+96.210	1138+94.210	Information: for segment #1 (1137+96.210 to 1138+94.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+96.210	1138+94.210	Information: for segment #1 (1137+96.210 to 1138+94.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+96.210	1138+94.210	Information: for segment #1 (1137+96.210 to 1138+94.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1138+94.210	1139+65.400	Information: for segment #2 (1138+94.210 to 1139+65.400), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1138+94.210	1139+65.400	Information: for segment #2 (1138+94.210 to 1139+65.400), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1138+94.210	1139+65.400	Information: for segment #2 (1138+94.210 to 1139+65.400), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1138+94.210	1139+65.400	Information: for segment #2 (1138+94.210 to 1139+65.400), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+65.400	1141+60.170	Information: for segment #3 (1139+65.400 to 1141+60.170), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+65.400	1141+60.170	Information: for segment #3 (1139+65.400 to 1141+60.170), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+65.400	1141+60.170	Information: for segment #3 (1139+65.400 to 1141+60.170), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+65.400	1141+60.170	Information: for segment #3 (1139+65.400 to 1141+60.170), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1141+60.170	1142+18.210	Information: for segment #4 (1141+60.170 to 1142+18.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1141+60.170	1142+18.210	Information: for segment #4 (1141+60.170 to 1142+18.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1141+60.170	1142+18.210	Information: for segment #4 (1141+60.170 to 1142+18.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1141+60.170	1142+18.210	Information: for segment #4 (1141+60.170 to 1142+18.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+18.210	1144+70.090	Information: for segment #5 (1142+18.210 to 1144+70.090), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+18.210	1144+70.090	Information: for segment #5 (1142+18.210 to 1144+70.090), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+18.210	1144+70.090	Information: for segment #5 (1142+18.210 to 1144+70.090), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+18.210	1144+70.090	Information: for segment #5 (1142+18.210 to 1144+70.090), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+70.090	1156+78.710	Information: for segment #6 (1144+70.090 to 1156+78.710), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+70.090	1156+78.710	Information: for segment #6 (1144+70.090 to 1156+78.710), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1158+42.210	1159+61.730	Information: for segment #11 (1158+42.210 to 1159+61.730), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+42.210	1159+61.730	Information: for segment #11 (1158+42.210 to 1159+61.730), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+42.210	1159+61.730	Information: for segment #11 (1158+42.210 to 1159+61.730), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+42.210	1159+61.730	Information: for segment #11 (1158+42.210 to 1159+61.730), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+08.210	Information: for segment #13 (1159+61.730 to 1160+08.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+08.210	Information: for segment #13 (1159+61.730 to 1160+08.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+08.210	Information: for segment #13 (1159+61.730 to 1160+08.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+08.210	Information: for segment #13 (1159+61.730 to 1160+08.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+08.210	1160+75.280	Information: for segment #14 (1160+08.210 to 1160+75.280), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+08.210	1160+75.280	Information: for segment #14 (1160+08.210 to 1160+75.280), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+08.210	1160+75.280	Information: for segment #14 (1160+08.210 to 1160+75.280), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+08.210	1160+75.280	Information: for segment #14 (1160+08.210 to 1160+75.280), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+75.280	1160+88.270	Information: for segment #15 (1160+75.280 to 1160+88.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1160+75.280	1160+88.270	Information: for segment #15 (1160+75.280 to 1160+88.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+75.280	1160+88.270	Information: for segment #15 (1160+75.280 to 1160+88.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+75.280	1160+88.270	Information: for segment #15 (1160+75.280 to 1160+88.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1157+46.730	1158+15.730	Information: for segment #8 (1157+46.730 to 1158+15.730), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+15.730	1158+42.210	Information: for segment #10 (1158+15.730 to 1158+42.210), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+42.210	1159+61.730	Information: for segment #12 (1158+42.210 to 1159+61.730), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+08.210	Information: for segment #13 (1159+61.730 to 1160+08.210), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1160+08.210	1160+75.280	Information: for segment #14 (1160+08.210 to 1160+75.280), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1160+75.280	1160+88.270	Information: for segment #15 (1160+75.280 to 1160+88.270), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 3
Evaluation Comment: Created Thu Jun 23 11:58:20 CDT 2022

Minimum Location: 1181+39.215
Maximum Location: 1301+70.260

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1181+39.215
Evaluation End Location: 1301+70.260
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_MV=1.0; FI_SV=1.0; PDO_MV=1.0; PDO_SV=1.0;

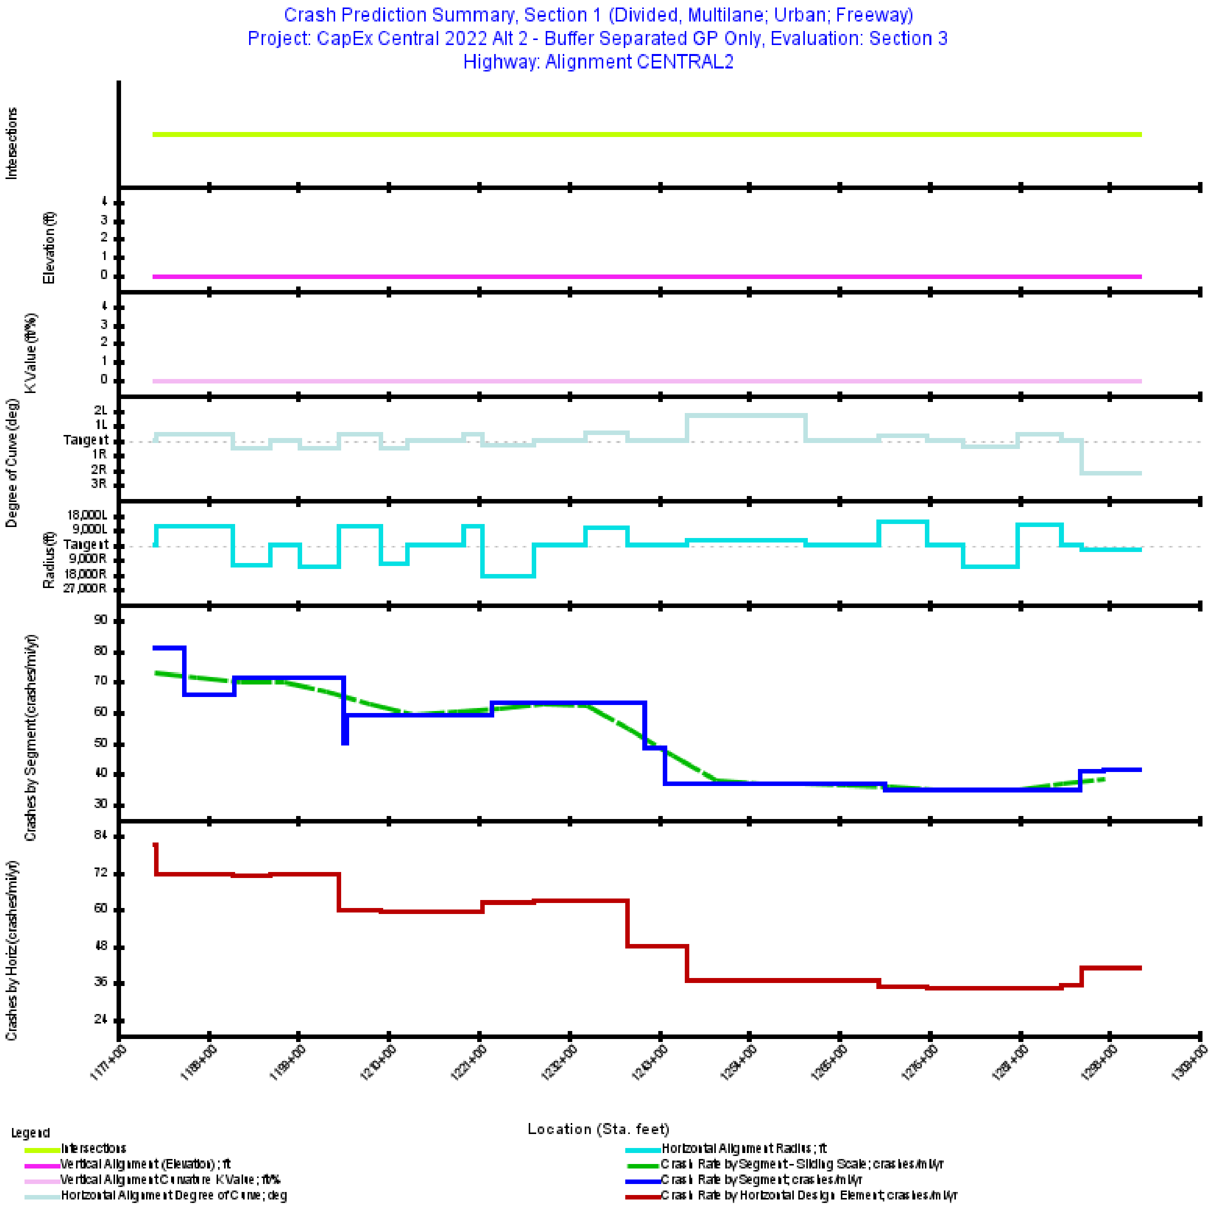

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Seven-lane Freeway	Urban	1181+39.215	1185+16.760	377.55	0.0715	2030: 181,000	58.00	Non-Traversable Median	66.00
2	Six-lane Freeway	Urban	1185+16.760	1191+27.480	610.72	0.1157	2030: 163,350	58.00	Non-Traversable Median	66.00
3	Seven-lane Freeway	Urban	1191+27.480	1204+51.660	1,324.18	0.2508	2030: 168,950	58.00	Non-Traversable Median	66.00
4	Six-lane Freeway	Urban	1204+51.660	1204+99.010	47.35	0.0090	2030: 135,350	58.00	Non-Traversable Median	66.00

Table 2. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**2.2786**
Average Future Road AADT (vpd)	**134,417**
Predicted Crashes	
Total Crashes	**116.18**
Fatal and Injury Crashes	**32.09**
Property-Damage-Only Crashes	**84.09**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**50.9863**
FI Crash Rate (crashes/mi/yr)	**14.0810**
PDO Crash Rate (crashes/mi/yr)	**36.9052**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**111.79**
Travel Crash Rate (crashes/million veh-mi)	**1.04**
Travel FI Crash Rate (crashes/million veh-mi)	**0.29**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.75**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.
Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 3. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1181+39.215	1185+16.760	0.0715	5.798	5.7980	1.5222	4.2759	81.0859	1.23
2	1185+16.760	1191+27.480	0.1157	7.616	7.6157	1.9521	5.6636	65.8415	1.10
3	1191+27.480	1204+51.660	0.2508	17.922	17.9216	4.7926	13.1290	71.4603	1.16
4	1204+51.660	1204+99.010	0.0090	0.447	0.4471	0.1202	0.3269	49.8584	1.01
5	1204+99.010	1222+62.550	0.3340	19.798	19.7982	5.3872	14.4110	59.2755	1.05
6	1222+62.550	1241+21.390	0.3521	22.207	22.2067	6.2872	15.9196	63.0778	1.06
7	1241+21.390	1243+70.050	0.0471	2.291	2.2911	0.6531	1.6380	48.6486	1.02
8	1243+70.050	1270+59.215	0.5093	18.782	18.7818	5.3217	13.4602	36.8769	0.96
9	1270+59.215	1294+38.280	0.4506	15.619	15.6191	4.4548	11.1643	34.6644	0.90
10	1294+38.280	1297+26.215	0.0545	2.228	2.2281	0.6244	1.6037	40.8572	1.06
11	1297+26.215	1301+70.260	0.0841	3.470	3.4701	0.9698	2.5003	41.2620	1.08
Total			2.2786	116.178	116.1776	32.0852	84.0925	50.9863	1.04

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 4. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

9	0.1004	0.2099	1.4753	2.6692	11.1643
10	0.0144	0.0303	0.2093	0.3704	1.6037
11	0.0228	0.0481	0.3276	0.5713	2.5003
Total	0.7178	1.4978	10.5863	19.2833	84.0925

Table 7. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.05	0.0	0.71	0.6	0.76	0.7
Highway Segment	Collision with Fixed Object	8.44	7.3	23.23	20.0	31.67	27.3
Highway Segment	Collision with Other Object	0.60	0.5	4.51	3.9	5.11	4.4
Highway Segment	Other Single-vehicle Collision	2.43	2.1	3.47	3.0	5.90	5.1
Highway Segment	Collision with Parked Vehicle	0.17	0.2	0.52	0.4	0.69	0.6
Highway Segment	Total Single Vehicle Crashes	11.69	10.1	32.45	27.9	44.13	38.0
Highway Segment	Right-Angle Collision	0.63	0.5	0.93	0.8	1.56	1.3
Highway Segment	Head-on Collision	0.16	0.1	0.10	0.1	0.27	0.2
Highway Segment	Other Multi-vehicle Collision	0.63	0.5	1.24	1.1	1.87	1.6
Highway Segment	Rear-end Collision	15.30	13.2	35.63	30.7	50.93	43.8
Highway Segment	Sideswipe, Same Direction Collision	3.67	3.2	13.74	11.8	17.41	15.0
Highway Segment	Total Multiple Vehicle Crashes	20.40	17.6	51.65	44.5	72.04	62.0
Highway Segment	Total Highway Segment Crashes	32.09	27.6	84.09	72.4	116.18	100.0
	Total Crashes	32.09	27.6	84.09	72.4	116.18	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 8. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1191+27.480	Information: for segment #2 (1185+16.760 to 1191+27.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1191+27.480	Information: for segment #2 (1185+16.760 to 1191+27.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1191+27.480	Information: for segment #2 (1185+16.760 to 1191+27.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1191+27.480	Information: for segment #2 (1185+16.760 to 1191+27.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #3 (1191+27.480 to 1204+51.660), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #3 (1191+27.480 to 1204+51.660), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #3 (1191+27.480 to 1204+51.660), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #3 (1191+27.480 to 1204+51.660), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #4 (1204+51.660 to 1204+99.010), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #4 (1204+51.660 to 1204+99.010), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #4 (1204+51.660 to 1204+99.010), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #4 (1204+51.660 to 1204+99.010), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+99.010	1222+62.550	Information: for segment #5 (1204+99.010 to 1222+62.550), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+99.010	1222+62.550	Information: for segment #5 (1204+99.010 to 1222+62.550), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+99.010	1222+62.550	Information: for segment #5 (1204+99.010 to 1222+62.550), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+99.010	1222+62.550	Information: for segment #5 (1204+99.010 to 1222+62.550), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1222+62.550	1241+21.390	Information: for segment #6 (1222+62.550 to 1241+21.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1222+62.550	1241+21.390	Information: for segment #6 (1222+62.550 to 1241+21.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1222+62.550	1241+21.390	Information: for segment #6 (1222+62.550 to 1241+21.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1222+62.550	1241+21.390	Information: for segment #6 (1222+62.550 to 1241+21.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1241+21.390	1243+70.050	Information: for segment #7 (1241+21.390 to 1243+70.050), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1241+21.390	1243+70.050	Information: for segment #7 (1241+21.390 to 1243+70.050), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1241+21.390	1243+70.050	Information: for segment #7 (1241+21.390 to 1243+70.050), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1243+70.050	1270+59.215	Information: for segment #8 (1243+70.050 to 1270+59.215), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1243+70.050	1270+59.215	Information: for segment #8 (1243+70.050 to 1270+59.215), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1243+70.050	1270+59.215	Information: for segment #8 (1243+70.050 to 1270+59.215), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1243+70.050	1270+59.215	Information: for segment #8 (1243+70.050 to 1270+59.215), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1270+59.215	1294+38.280	Information: for segment #9 (1270+59.215 to 1294+38.280), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1270+59.215	1294+38.280	Information: for segment #9 (1270+59.215 to 1294+38.280), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1270+59.215	1294+38.280	Information: for segment #9 (1270+59.215 to 1294+38.280), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1270+59.215	1294+38.280	Information: for segment #9 (1270+59.215 to 1294+38.280), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1294+38.280	1297+26.215	Information: for segment #10 (1294+38.280 to 1297+26.215), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1294+38.280	1297+26.215	Information: for segment #10 (1294+38.280 to 1297+26.215), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1294+38.280	1297+26.215	Information: for segment #10 (1294+38.280 to 1297+26.215), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1294+38.280	1297+26.215	Information: for segment #10 (1294+38.280 to 1297+26.215), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1297+26.215	1301+70.260	Information: for segment #11 (1297+26.215 to 1301+70.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1297+26.215	1301+70.260	Information: for segment #11 (1297+26.215 to 1301+70.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1297+26.215	1301+70.260	Information: for segment #11 (1297+26.215 to 1301+70.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1297+26.215	1301+70.260	Information: for segment #11 (1297+26.215 to 1301+70.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Warning: for segment #1 (1181+39.215 to 1185+16.760), traffic volume (181,000 vpd) for 2030 is not within the model limit (180,000 vpd) for reliable results for segment type 6F

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1191+27.480	1204+51.660	Information: for segment #3 (1191+27.480 to 1204+51.660), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1204+99.010	1222+62.550	Information: for segment #5 (1204+99.010 to 1222+62.550), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1241+21.390	1243+70.050	Information: for segment #7 (1241+21.390 to 1243+70.050), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 4
Evaluation Comment: Created Thu Jun 23 11:59:39 CDT 2022

Minimum Location: 1343+13.390
Maximum Location: 1418+67.223

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1343+13.390
Evaluation End Location: 1418+67.223
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EN=1.0; FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EN=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

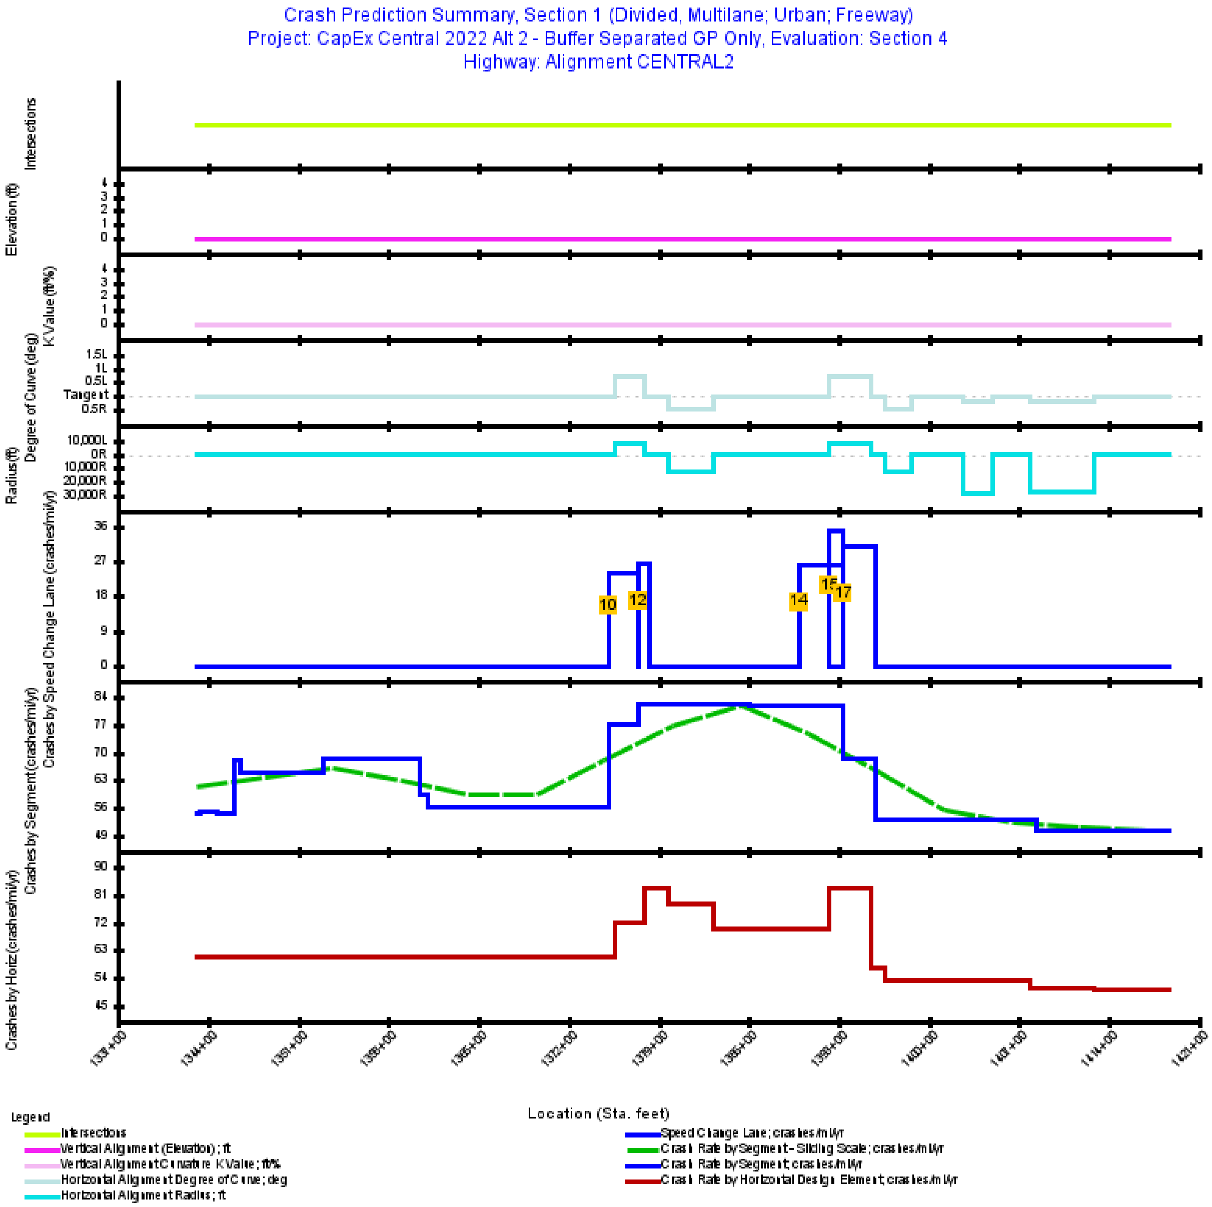

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Eight-lane Freeway	Urban	1343+13.390	1343+39.350	25.96	0.0049	2030: 158,050	58.00	Non-Traversable Median	67.95
2	Eight-lane Freeway	Urban	1343+39.350	1344+71.390	132.04	0.0250	2030: 158,050	58.00	Non-Traversable Median	67.37
3	Eight-lane Freeway	Urban	1344+71.390	1346+07.390	136.00	0.0258	2030: 158,050	58.00	Non-Traversable Median	66.61
4	Ten-lane Freeway	Urban	1346+07.390	1346+47.920	40.53	0.0077	2030: 185,350	58.00	Non-Traversable Median	66.11
5	Ten-lane Freeway	Urban	1346+47.920	1352+90.390	642.47	0.1217	2030: 185,350	57.92	Non-Traversable Median	64.50
6	Ten-lane Freeway	Urban	1352+90.390	1360+45.180	754.79	0.1430	2030: 185,350	54.00	Non-Traversable Median	62.50
7	Nine-lane Freeway	Urban	1360+45.180	1361+05.390	60.21	0.0114	2030: 172,950	54.00	Non-Traversable Median	62.00
8	Eight-lane Freeway	Urban	1361+05.390	1375+07.630	1,402.24	0.2656	2030: 158,850	54.00	Non-Traversable Median	62.00
9	Eight-lane Freeway	Urban	1375+07.630	1377+39.570	231.94	0.0439	2030: 182,900	54.00	Non-Traversable Median	62.00
11	Nine-lane Freeway	Urban	1377+39.570	1386+00.390	860.82	0.1630	2030: 203,000	54.00	Non-Traversable Median	62.50
13	Nine-lane Freeway	Urban	1386+00.390	1393+33.520	733.13	0.1389	2030: 203,000	58.00	Non-Traversable Median	64.50
16	Eight-lane Freeway	Urban	1393+33.520	1395+79.430	245.91	0.0466	2030: 168,550	58.00	Non-Traversable Median	66.00
18	Seven-lane Freeway	Urban	1395+79.430	1408+12.390	1,232.96	0.2335	2030: 147,550	58.00	Non-Traversable Median	69.50
19	Seven-lane Freeway	Urban	1408+12.390	1408+39.350	26.96	0.0051	2030: 147,550	65.18	Non-Traversable Median	73.18
20	Eight-lane Freeway	Urban	1408+39.350	1418+67.223	1,027.87	0.1947	2030: 147,550	70.00	Non-Traversable Median	75.67

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
10	Eight-lane Freeway Speed Change	Exit	1375+07.630	1377+39.570	231.94	0.0439	2030: 182,900	54.00	Non-Traversable Median	62.00
12	Nine-lane Freeway Speed Change	Exit	1377+39.570	1378+27.630	88.06	0.0167	2030: 203,000	54.00	Non-Traversable Median	62.00
14	Nine-lane Freeway Speed Change	Exit	1389+88.520	1393+33.520	345.00	0.0653	2030: 203,000	58.00	Non-Traversable Median	66.00
15	Nine-lane Freeway Speed Change	Entrance	1392+24.430	1393+33.520	109.09	0.0207	2030: 203,000	58.00	Non-Traversable Median	66.00
17	Eight-lane Freeway Speed Change	Entrance	1393+33.520	1395+79.430	245.91	0.0466	2030: 168,550	58.00	Non-Traversable Median	66.00

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.3341**
Average Future Road AADT (vpd)	**169,533**
Predicted Crashes	
Total Crashes	**83.23**
Fatal and Injury Crashes	**23.49**
Property-Damage-Only Crashes	**59.74**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**62.3882**
FI Crash Rate (crashes/mi/yr)	**17.6085**
PDO Crash Rate (crashes/mi/yr)	**44.7796**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**82.55**
Travel Crash Rate (crashes/million veh-mi)	**1.01**
Travel FI Crash Rate (crashes/million veh-mi)	**0.28**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.72**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.1932**
Average Future Road AADT (vpd)	**95,062**
Predicted Crashes	
Total Crashes	**5.36**
Fatal and Injury Crashes	**1.76**
Property-Damage-Only Crashes	**3.60**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**33**
Percent Property-Damage-Only Crashes (%)	**67**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**27.7288**
FI Crash Rate (crashes/mi/yr)	**9.1059**
PDO Crash Rate (crashes/mi/yr)	**18.6229**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**6.70**
Travel Crash Rate (crashes/million veh-mi)	**0.80**
Travel FI Crash Rate (crashes/million veh-mi)	**0.26**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.54**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1343+13.390	1343+39.350	0.0049	0.270	0.2697	0.0745	0.1951	54.8496	0.95

Highway Segment	Total Highway Segment Crashes	0.79	36.8	1.36	63.2	2.16	100.0
	Total Crashes	0.79	36.8	1.36	63.2	2.16	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 14. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1343+13.390	1343+39.350	Information: for segment #1 (1343+13.390 to 1343+39.350), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+13.390	1343+39.350	Information: for segment #1 (1343+13.390 to 1343+39.350), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+13.390	1343+39.350	Information: for segment #1 (1343+13.390 to 1343+39.350), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+13.390	1343+39.350	Information: for segment #1 (1343+13.390 to 1343+39.350), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+39.350	1344+71.390	Information: for segment #2 (1343+39.350 to 1344+71.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+39.350	1344+71.390	Information: for segment #2 (1343+39.350 to 1344+71.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+39.350	1344+71.390	Information: for segment #2 (1343+39.350 to 1344+71.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+39.350	1344+71.390	Information: for segment #2 (1343+39.350 to 1344+71.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+71.390	1346+07.390	Information: for segment #3 (1344+71.390 to 1346+07.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+71.390	1346+07.390	Information: for segment #3 (1344+71.390 to 1346+07.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+71.390	1346+07.390	Information: for segment #3 (1344+71.390 to 1346+07.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+71.390	1346+07.390	Warning: for segment #3 (1344+71.390 to 1346+07.390), Outside barrier offset (8.00 feet) is less than the left outside shoulder width (9.00 feet). This indicates there is problem with the input data.
1346+07.390	1346+47.920	Information: for segment #4 (1346+07.390 to 1346+47.920), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+07.390	1346+47.920	Information: for segment #4 (1346+07.390 to 1346+47.920), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+07.390	1346+47.920	Information: for segment #4 (1346+07.390 to 1346+47.920), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+07.390	1346+47.920	Information: for segment #4 (1346+07.390 to 1346+47.920), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+47.920	1352+90.390	Information: for segment #5 (1346+47.920 to 1352+90.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+47.920	1352+90.390	Information: for segment #5 (1346+47.920 to 1352+90.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+47.920	1352+90.390	Information: for segment #5 (1346+47.920 to 1352+90.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+47.920	1352+90.390	Information: for segment #5 (1346+47.920 to 1352+90.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1352+90.390	1360+45.180	Information: for segment #6 (1352+90.390 to 1360+45.180), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1352+90.390	1360+45.180	Information: for segment #6 (1352+90.390 to 1360+45.180), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1352+90.390	1360+45.180	Information: for segment #6 (1352+90.390 to 1360+45.180), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1352+90.390	1360+45.180	Information: for segment #6 (1352+90.390 to 1360+45.180), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Information: for segment #7 (1360+45.180 to 1361+05.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Information: for segment #7 (1360+45.180 to 1361+05.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Information: for segment #7 (1360+45.180 to 1361+05.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Warning: for segment #7 (1360+45.180 to 1361+05.390), Outside barrier offset (8.00 feet) is less than the left outside shoulder width (9.00 feet). This indicates there is problem with the input data.

1408+12.390	1408+39.350	Information: for segment #19 (1408+12.390 to 1408+39.350), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1377+39.570	1378+27.630	Information: for segment #12 (1377+39.570 to 1378+27.630), Speed Change Segment of type Nine-lane Freeway Speed Change is using unbalanced lane processing with types Eight-lane Freeway Speed Change and Ten-lane Freeway Speed Change
1389+88.520	1393+33.520	Information: for segment #14 (1389+88.520 to 1393+33.520), Speed Change Segment of type Nine-lane Freeway Speed Change is using unbalanced lane processing with types Eight-lane Freeway Speed Change and Ten-lane Freeway Speed Change
1392+24.430	1393+33.520	Information: for segment #15 (1392+24.430 to 1393+33.520), Speed Change Segment of type Nine-lane Freeway Speed Change is using unbalanced lane processing with types Eight-lane Freeway Speed Change and Ten-lane Freeway Speed Change

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Buffer Separated GP+ML
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 1
Evaluation Comment: Created Thu Jun 23 12:01:54 CDT 2022

Minimum Location: 1000+00.000
Maximum Location: 1086+14.425

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1086+14.425
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_MV=1.0; FI_SV=1.0; PDO_MV=1.0; PDO_SV=1.0;

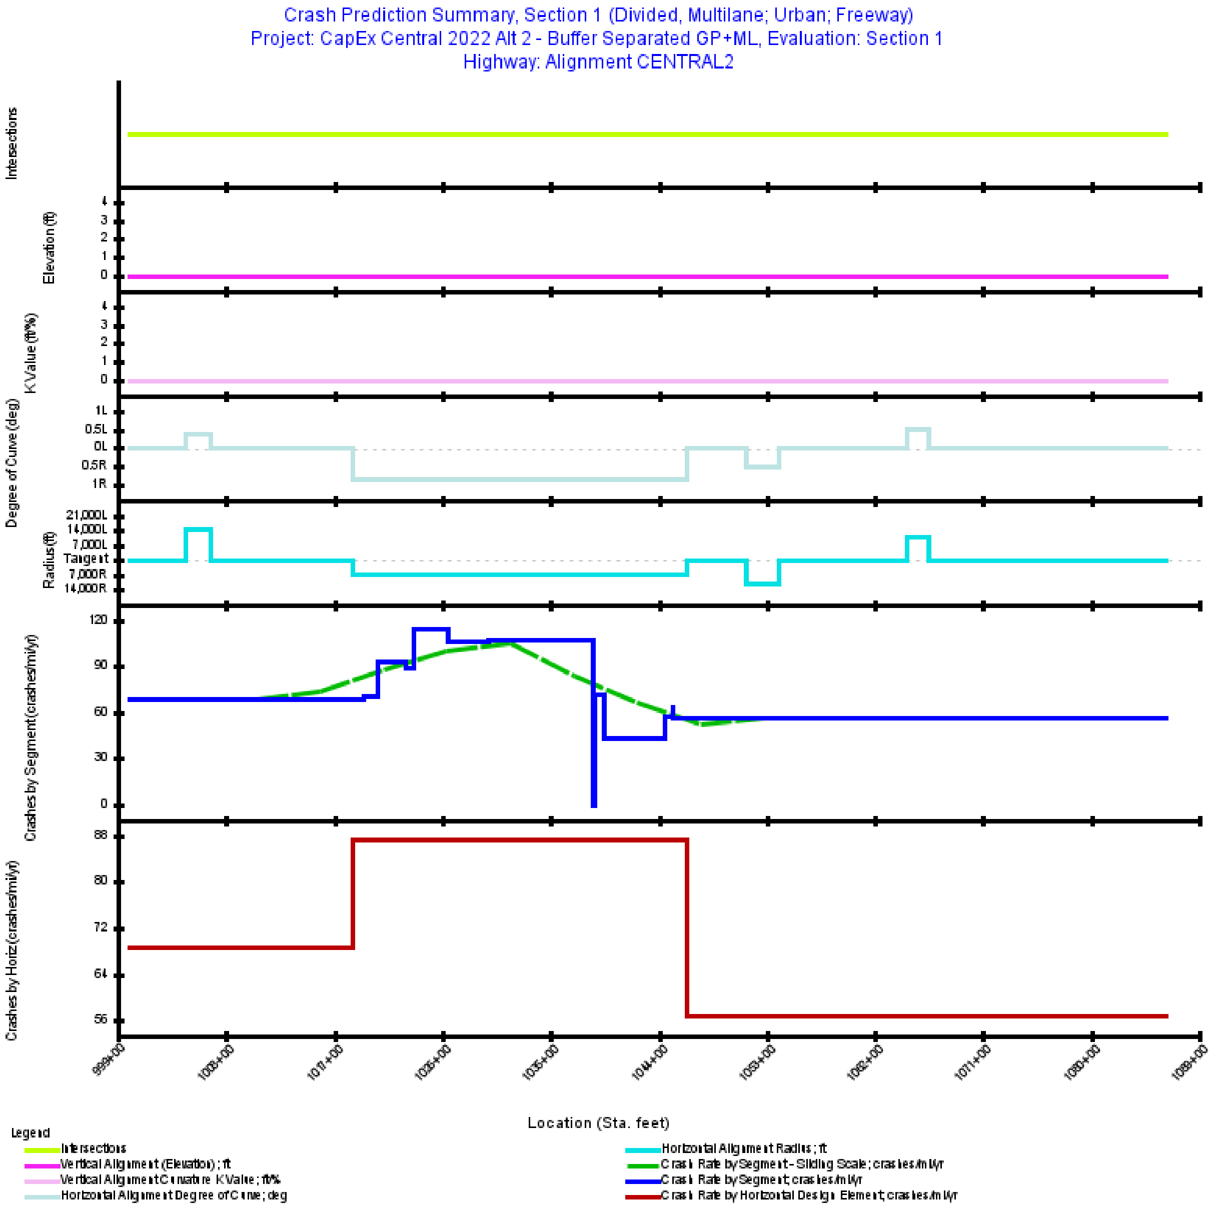

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1000+00.000	1019+49.000	1,949.00	0.3691	2030: 203,650	16.00	Non-Traversable Median	30.50
2	Ten-lane Freeway	Urban	1019+49.000	1020+63.580	114.58	0.0217	2030: 203,650	26.66	Non-Traversable Median	34.66
3	Ten-lane Freeway	Urban	1020+63.580	1022+96.000	232.42	0.0440	2030: 210,700	31.67	Non-Traversable Median	39.67
4	Ten-lane Freeway	Urban	1022+96.000	1023+61.570	65.57	0.0124	2030: 210,700	35.97	Non-Traversable Median	43.97
5	Ten-lane Freeway	Urban	1023+61.570	1026+42.000	280.43	0.0531	2030: 224,050	40.96	Non-Traversable Median	48.96
6	Ten-lane Freeway	Urban	1026+42.000	1029+89.000	347.00	0.0657	2030: 224,050	50.02	Non-Traversable Median	58.02
7	Ten-lane Freeway	Urban	1029+89.000	1038+61.000	872.00	0.1652	2030: 224,050	62.66	Non-Traversable Median	36.51
8	Ten-lane Freeway	Urban	1038+61.000	1038+65.500	4.50	0.0009	2030: 224,050	2.00	Non-Traversable Median	10.00
9	Ten-lane Freeway	Urban	1038+65.500	1039+48.030	82.53	0.0156	2030: 179,650	2.00	Non-Traversable Median	10.00
10	Ten-lane Freeway	Urban	1039+48.030	1044+52.820	504.79	0.0956	2030: 142,550	2.00	Non-Traversable Median	11.35
11	Ten-lane Freeway	Urban	1044+52.820	1044+78.000	25.18	0.0048	2030: 148,350	4.86	Non-Traversable Median	12.86
12	Ten-lane Freeway	Urban	1044+78.000	1045+10.700	32.70	0.0062	2030: 148,350	5.19	Non-Traversable Median	13.19
13	Ten-lane Freeway	Urban	1045+10.700	1045+21.090	10.39	0.0020	2030: 148,350	5.44	Non-Traversable Median	13.44
14	Ten-lane Freeway	Urban	1045+21.090	1086+14.425	4,093.33	0.7753	2030: 153,000	5.00	Non-Traversable Median	13.25

Table 2. User Defined CMF Used in the Eval Segment CPM Evaluation (Section 1)

Name	Description	Start Loc. (Sta. ft)	End Loc. (Sta. ft)	Start CMF Year	End CMF Year	Severity	CMF Value
11	remove 20 left	1020+63.580	1023+61.570	2030	2050	Total	1.1000
12	remove 20 both	1023+61.570	1038+65.500	2030	2050	Total	1.2000
11	remove 20 right	1038+65.500	1039+48.030	2030	2050	Total	1.1000
11	remove 10 left	1044+52.820	1045+21.090	2030	2050	Total	1.1000
12	remove 10 both	1045+21.090	1086+14.425	2030	2050	Total	1.2000

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.6307**
Average Future Road AADT (vpd)	**179,116**
Predicted Crashes	
Total Crashes	**112.74**
Fatal and Injury Crashes	**32.43**
Property-Damage-Only Crashes	**80.31**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**69.1351**
FI Crash Rate (crashes/mi/yr)	**19.8852**
PDO Crash Rate (crashes/mi/yr)	**49.2499**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**106.61**
Travel Crash Rate (crashes/million veh-mi)	**1.06**
Travel FI Crash Rate (crashes/million veh-mi)	**0.30**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.75**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 4. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1000+00.000	1019+49.000	0.3691	25.313	25.3127	7.0852	18.2276	68.5743	0.92
2	1019+49.000	1020+63.580	0.0217	1.531	1.5314	0.4275	1.1039	70.5693	0.95

Total	0.7044	1.4607	10.5412	19.7199	80.3102

Table 8. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.05	0.0	0.68	0.6	0.73	0.7
Highway Segment	Collision with Fixed Object	9.02	8.0	22.25	19.7	31.27	27.7
Highway Segment	Collision with Other Object	0.64	0.6	4.32	3.8	4.96	4.4
Highway Segment	Other Single-vehicle Collision	2.60	2.3	3.33	2.9	5.92	5.3
Highway Segment	Collision with Parked Vehicle	0.19	0.2	0.50	0.4	0.69	0.6
Highway Segment	Total Single Vehicle Crashes	12.49	11.1	31.07	27.6	43.56	38.6
Highway Segment	Right-Angle Collision	0.62	0.5	0.89	0.8	1.50	1.3
Highway Segment	Head-on Collision	0.16	0.1	0.10	0.1	0.26	0.2
Highway Segment	Other Multi-vehicle Collision	0.62	0.5	1.18	1.0	1.80	1.6
Highway Segment	Rear-end Collision	14.95	13.3	33.98	30.1	48.92	43.4
Highway Segment	Sideswipe, Same Direction Collision	3.59	3.2	13.10	11.6	16.69	14.8
Highway Segment	Total Multiple Vehicle Crashes	19.93	17.7	49.24	43.7	69.17	61.4
Highway Segment	Total Highway Segment Crashes	32.43	28.8	80.31	71.2	112.74	100.0
	Total Crashes	32.43	28.8	80.31	71.2	112.74	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 9. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1000+00.000	1019+49.000	Information: for segment #1 (1000+00.000 to 1019+49.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1019+49.000	Information: for segment #1 (1000+00.000 to 1019+49.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1019+49.000	Information: for segment #1 (1000+00.000 to 1019+49.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1019+49.000	Information: for segment #1 (1000+00.000 to 1019+49.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+49.000	1020+63.580	Information: for segment #2 (1019+49.000 to 1020+63.580), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+49.000	1020+63.580	Information: for segment #2 (1019+49.000 to 1020+63.580), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+49.000	1020+63.580	Information: for segment #2 (1019+49.000 to 1020+63.580), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+49.000	1020+63.580	Information: for segment #2 (1019+49.000 to 1020+63.580), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+96.000	Information: for segment #3 (1020+63.580 to 1022+96.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+96.000	Information: for segment #3 (1020+63.580 to 1022+96.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+96.000	Information: for segment #3 (1020+63.580 to 1022+96.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1020+63.580	1022+96.000	Information: for segment #3 (1020+63.580 to 1022+96.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+96.000	1023+61.570	Information: for segment #4 (1022+96.000 to 1023+61.570), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+96.000	1023+61.570	Information: for segment #4 (1022+96.000 to 1023+61.570), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+96.000	1023+61.570	Information: for segment #4 (1022+96.000 to 1023+61.570), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1022+96.000	1023+61.570	Information: for segment #4 (1022+96.000 to 1023+61.570), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+42.000	Information: for segment #5 (1023+61.570 to 1026+42.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+42.000	Information: for segment #5 (1023+61.570 to 1026+42.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+42.000	Information: for segment #5 (1023+61.570 to 1026+42.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+61.570	1026+42.000	Information: for segment #5 (1023+61.570 to 1026+42.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1026+42.000	1029+89.000	Information: for segment #6 (1026+42.000 to 1029+89.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1026+42.000	1029+89.000	Information: for segment #6 (1026+42.000 to 1029+89.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Maximum Location: 1160+88.270

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1137+96.210
Evaluation End Location: 1160+88.270
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

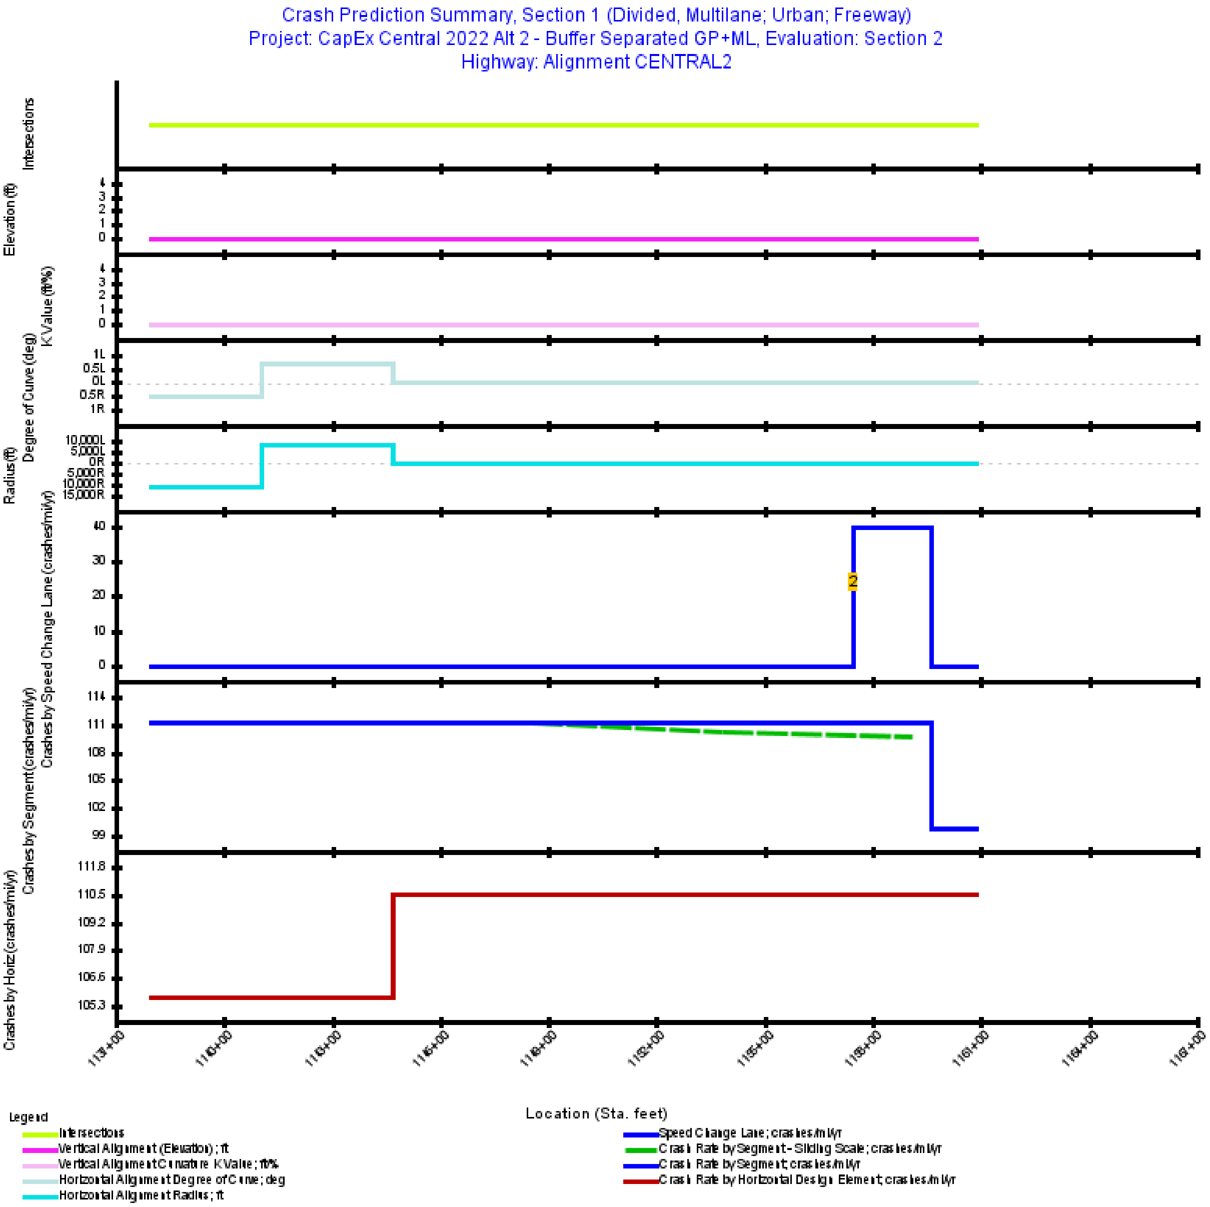

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1137+96.210	1159+61.730	2,165.52	0.4101	2030: 216,900	14.00	Non-Traversable Median	19.00
3	Ten-lane Freeway	Urban	1159+61.730	1160+88.270	126.54	0.0240	2030: 200,650	14.00	Non-Traversable Median	22.00

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
2	Ten-lane Freeway Speed Change	Exit	1157+46.730	1159+61.730	215.00	0.0407	2030: 216,900	14.00	Non-Traversable Median	22.00

Table 3. User Defined CMF Used in the Eval Segment CPM Evaluation (Section 1)

Name	Description	Start Loc. (Sta. ft)	End Loc. (Sta. ft)	Start CMF Year	End CMF Year	Severity	CMF Value
14	remove 10 both, remove 20 both	1137+96.210	1159+61.730	2030	2050	Total	1.4000
13	remove 10 both, remove 20 left	1159+61.730	1160+88.270	2030	2050	Total	1.3000

Table 4. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.4137**
Average Future Road AADT (vpd)	**215,959**
Predicted Crashes	
Total Crashes	**45.74**
Fatal and Injury Crashes	**12.65**
Property-Damage-Only Crashes	**33.09**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**110.5604**
FI Crash Rate (crashes/mi/yr)	**30.5767**
PDO Crash Rate (crashes/mi/yr)	**79.9837**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**32.61**
Travel Crash Rate (crashes/million veh-mi)	**1.40**
Travel FI Crash Rate (crashes/million veh-mi)	**0.39**
Travel PDO Crash Rate (crashes/million veh-mi)	**1.01**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 5. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0407**
Average Future Road AADT (vpd)	**108,450**
Predicted Crashes	
Total Crashes	**1.63**
Fatal and Injury Crashes	**0.53**
Property-Damage-Only Crashes	**1.10**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**32**
Percent Property-Damage-Only Crashes (%)	**68**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**39.9915**
FI Crash Rate (crashes/mi/yr)	**12.9509**
PDO Crash Rate (crashes/mi/yr)	**27.0407**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**1.61**
Travel Crash Rate (crashes/million veh-mi)	**1.01**
Travel FI Crash Rate (crashes/million veh-mi)	**0.33**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.68**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 6. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1137+96.210	1159+61.730	0.3898	43.351	43.3509	11.9764	31.3745	111.2198	1.41
3	1159+61.730	1160+88.270	0.0240	2.393	2.3927	0.6745	1.7182	99.8364	1.36
Total			0.4137	45.743	45.7435	12.6509	33.0926	110.5604	1.40

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 7. Predicted Crash Frequencies and Rates by Freeway Speed Change Lane (Speed Change)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
2	1157+46.730	1159+61.730	0.0407	1.628	1.6284	0.5274	1.1011	39.9915	1.01
Total			0.0407	1.628	1.6284	0.5274	1.1011	39.9915	1.01

Note: *Travel Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 8. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
Simple Curve 1	1137+96.210	1141+05.636	0.0586	6.194	6.1943	1.7113	4.4830	105.6987	1.41
Simple Curve 2	1141+05.636	1144+70.088	0.0690	7.296	7.2958	2.0156	5.2803	105.6987	1.41
Tangent	1144+70.088	1160+88.270	0.3065	33.882	33.8818	9.4514	24.4305	110.5537	1.54

Table 9. Predicted Crash Frequencies by Year (Section 1)

Year	Total Crashes	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)
2030	47.37	13.18	27.819	34.19	72.181
Total	47.37	13.18	27.819	34.19	72.181
Average	47.37	13.18	27.819	34.19	72.181

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 10. Predicted Crash Severity by Freeway Segment (Section 1)

Seg. No.	Fatal (K) Crashes (crashes)	Incapacitating Injury (A) Crashes (crashes)	Non-Incapacitating Injury (B) Crashes (crashes)	Possible Injury (C) Crashes (crashes)	No Injury (O) Crashes (crashes)
1	0.2546	0.5248	3.8549	7.3422	31.3745
3	0.0136	0.0278	0.2119	0.4212	1.7182
Total	0.2682	0.5526	4.0667	7.7634	33.0926

Table 11. Predicted Crash Severity by Speed Change Lane (Speed Change)

Seg. No.	Fatal (K) Crashes (crashes)	Incapacitating Injury (A) Crashes (crashes)	Non-Incapacitating Injury (B) Crashes (crashes)	Possible Injury (C) Crashes (crashes)	No Injury (O) Crashes (crashes)
2	0.0107	0.0217	0.1656	0.3293	1.1011

Table 12. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.02	0.0	0.25	0.5	0.27	0.6
Highway Segment	Collision with Fixed Object	3.16	6.9	8.14	17.8	11.30	24.7
Highway Segment	Collision with Other Object	0.22	0.5	1.58	3.5	1.80	3.9

Highway Segment	Collision with Parked Vehicle	0.07	0.1	0.18	0.4	0.25	0.5
Highway Segment	Total Single Vehicle Crashes	4.38	9.6	11.37	24.8	15.74	34.4
Highway Segment	Right-Angle Collision	0.26	0.6	0.39	0.9	0.65	1.4
Highway Segment	Head-on Collision	0.07	0.1	0.04	0.1	0.11	0.2
Highway Segment	Other Multi-vehicle Collision	0.26	0.6	0.52	1.1	0.78	1.7
Highway Segment	Rear-end Collision	6.21	13.6	14.99	32.8	21.20	46.3
Highway Segment	Sideswipe, Same Direction Collision	1.49	3.3	5.78	12.6	7.27	15.9
Highway Segment	Total Multiple Vehicle Crashes	8.27	18.1	21.73	47.5	30.00	65.6
Highway Segment	Total Highway Segment Crashes	12.65	27.7	33.09	72.3	45.74	100.0
	Total Crashes	12.65	27.7	33.09	72.3	45.74	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.01	0.5	0.01	0.5
Highway Segment	Collision with Fixed Object	0.10	6.3	0.23	14.0	0.33	20.3
Highway Segment	Collision with Other Object	0.01	0.5	0.03	2.0	0.04	2.5
Highway Segment	Other Single-vehicle Collision	0.03	1.6	0.03	1.6	0.05	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.14	8.5	0.29	18.1	0.43	26.5
Highway Segment	Right-Angle Collision	0.01	0.4	0.01	0.8	0.02	1.2
Highway Segment	Head-on Collision	0.00	0.2	0.00	0.1	0.01	0.3
Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.02	1.1	0.03	1.6
Highway Segment	Rear-end Collision	0.29	17.8	0.62	38.2	0.91	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.08	5.1	0.15	9.3	0.23	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.39	23.9	0.81	49.6	1.20	73.5
Highway Segment	Total Highway Segment Crashes	0.53	32.4	1.10	67.6	1.63	100.0
	Total Crashes	0.53	32.4	1.10	67.6	1.63	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 14. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1137+96.210	1159+61.730	Information: for segment #1 (1137+96.210 to 1159+61.730), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+96.210	1159+61.730	Information: for segment #1 (1137+96.210 to 1159+61.730), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+96.210	1159+61.730	Information: for segment #1 (1137+96.210 to 1159+61.730), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+96.210	1159+61.730	Information: for segment #1 (1137+96.210 to 1159+61.730), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+88.270	Information: for segment #3 (1159+61.730 to 1160+88.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+88.270	Information: for segment #3 (1159+61.730 to 1160+88.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+88.270	Information: for segment #3 (1159+61.730 to 1160+88.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1159+61.730	1160+88.270	Information: for segment #3 (1159+61.730 to 1160+88.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1157+46.730	1159+61.730	Information: for segment #2 (1157+46.730 to 1159+61.730), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Project Title: CapEx Central 2022 Alt 2 - Buffer Separated GP+ML
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 3
Evaluation Comment: Created Thu Jun 23 12:05:04 CDT 2022

Minimum Location: 1181+39.215
Maximum Location: 1301+70.260

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1181+39.215
Evaluation End Location: 1301+70.260
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_MV=1.0; FI_SV=1.0; PDO_MV=1.0; PDO_SV=1.0;

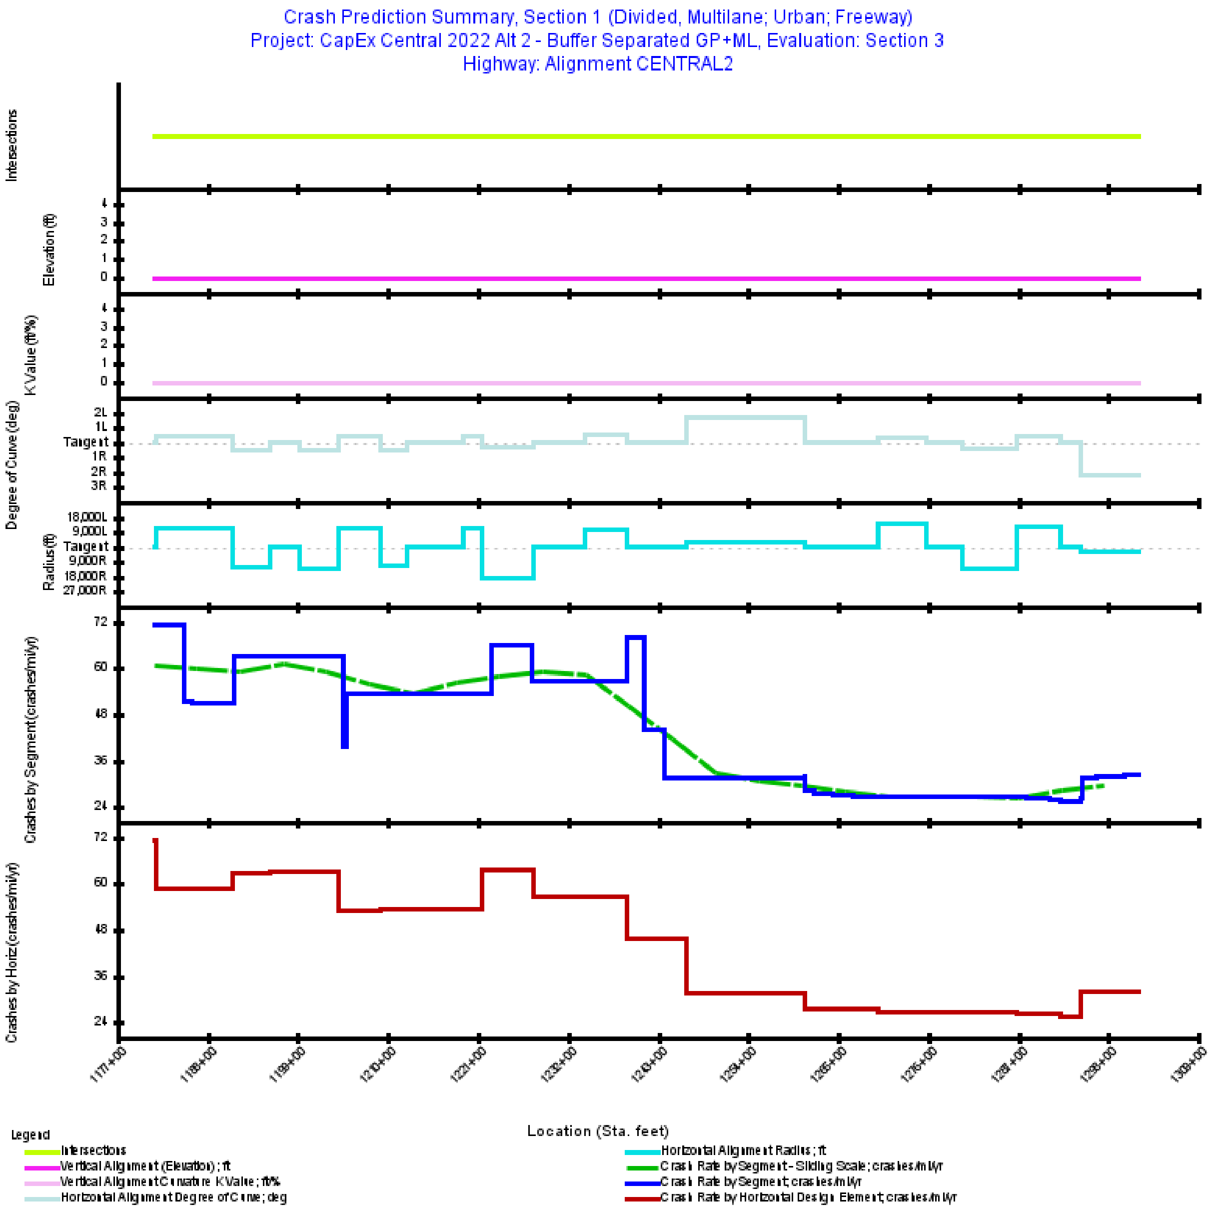

Figure 1. Crash Prediction Summary (Section 1)

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**2.2786**
Average Future Road AADT (vpd)	**134,417**
Predicted Crashes	
Total Crashes	**99.93**
Fatal and Injury Crashes	**30.76**
Property-Damage-Only Crashes	**69.17**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**31**
Percent Property-Damage-Only Crashes (%)	**69**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**43.8571**
FI Crash Rate (crashes/mi/yr)	**13.4991**
PDO Crash Rate (crashes/mi/yr)	**30.3580**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**111.79**
Travel Crash Rate (crashes/million veh-mi)	**0.89**
Travel FI Crash Rate (crashes/million veh-mi)	**0.28**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.62**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 4. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Table 8. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.06	0.1	0.69	0.7	0.75	0.8
Highway Segment	Collision with Fixed Object	9.99	10.0	22.63	22.6	32.62	32.6
Highway Segment	Collision with Other Object	0.71	0.7	4.39	4.4	5.10	5.1
Highway Segment	Other Single-vehicle Collision	2.88	2.9	3.38	3.4	6.26	6.3
Highway Segment	Collision with Parked Vehicle	0.21	0.2	0.51	0.5	0.71	0.7
Highway Segment	Total Single Vehicle Crashes	13.84	13.8	31.61	31.6	45.45	45.5
Highway Segment	Right-Angle Collision	0.53	0.5	0.68	0.7	1.20	1.2
Highway Segment	Head-on Collision	0.14	0.1	0.07	0.1	0.21	0.2
Highway Segment	Other Multi-vehicle Collision	0.53	0.5	0.90	0.9	1.43	1.4
Highway Segment	Rear-end Collision	12.69	12.7	25.92	25.9	38.61	38.6
Highway Segment	Sideswipe, Same Direction Collision	3.05	3.0	9.99	10.0	13.04	13.0
Highway Segment	Total Multiple Vehicle Crashes	16.92	16.9	37.57	37.6	54.49	54.5
Highway Segment	Total Highway Segment Crashes	30.76	30.8	69.17	69.2	99.93	100.0
	Total Crashes	30.76	30.8	69.17	69.2	99.93	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 9. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1181+39.215	1185+16.760	Information: for segment #1 (1181+39.215 to 1185+16.760), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1186+06.215	Information: for segment #2 (1185+16.760 to 1186+06.215), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1186+06.215	Information: for segment #2 (1185+16.760 to 1186+06.215), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1186+06.215	Information: for segment #2 (1185+16.760 to 1186+06.215), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1185+16.760	1186+06.215	Information: for segment #2 (1185+16.760 to 1186+06.215), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+06.215	1191+27.480	Information: for segment #3 (1186+06.215 to 1191+27.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+06.215	1191+27.480	Information: for segment #3 (1186+06.215 to 1191+27.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+06.215	1191+27.480	Information: for segment #3 (1186+06.215 to 1191+27.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+06.215	1191+27.480	Information: for segment #3 (1186+06.215 to 1191+27.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #4 (1191+27.480 to 1204+51.660), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #4 (1191+27.480 to 1204+51.660), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #4 (1191+27.480 to 1204+51.660), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1191+27.480	1204+51.660	Information: for segment #4 (1191+27.480 to 1204+51.660), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #5 (1204+51.660 to 1204+99.010), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #5 (1204+51.660 to 1204+99.010), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #5 (1204+51.660 to 1204+99.010), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+51.660	1204+99.010	Information: for segment #5 (1204+51.660 to 1204+99.010), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+99.010	1222+62.550	Information: for segment #6 (1204+99.010 to 1222+62.550), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1204+99.010	1222+62.550	Information: for segment #6 (1204+99.010 to 1222+62.550), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Maximum Location: 1418+67.223

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1343+13.390
Evaluation End Location: 1418+67.223
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EN=1.0; FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EN=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

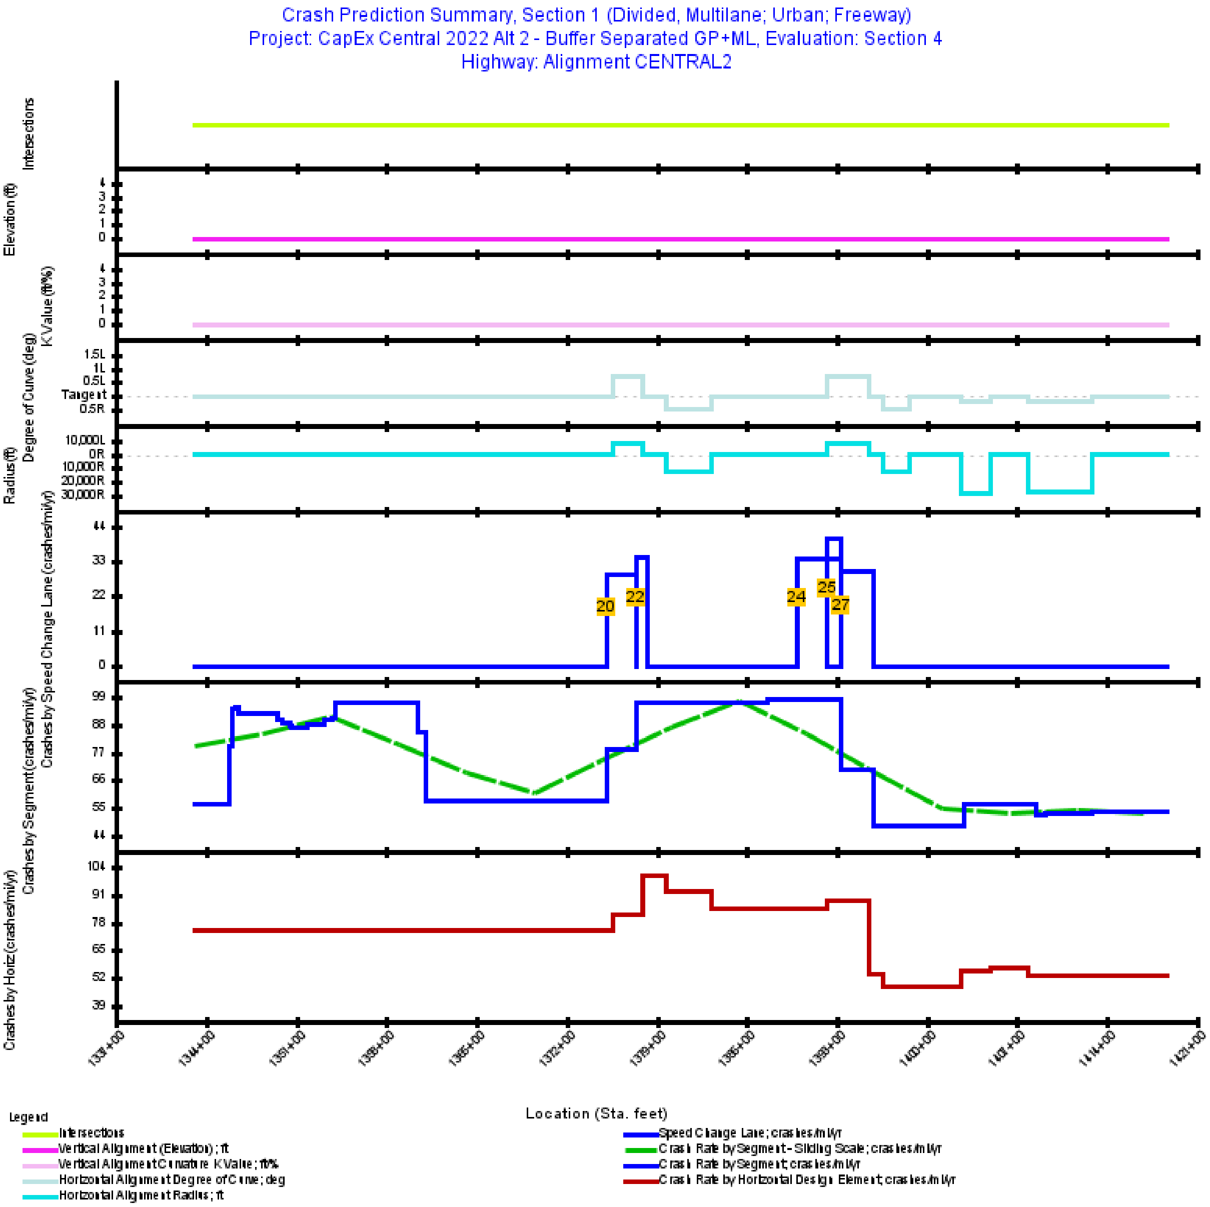

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1343+13.390	1345+47.920	234.53	0.0444	2030: 158,050	2.00	Non-Traversable Median	14.00
2	Ten-lane Freeway	Urban	1345+47.920	1345+73.390	25.47	0.0048	2030: 158,050	2.51	Non-Traversable Median	14.00

Table 4. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.3341**
Average Future Road AADT (vpd)	**169,533**
Predicted Crashes	
Total Crashes	**95.53**
Fatal and Injury Crashes	**28.02**
Property-Damage-Only Crashes	**67.50**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**71.6074**
FI Crash Rate (crashes/mi/yr)	**21.0070**
PDO Crash Rate (crashes/mi/yr)	**50.6004**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**82.55**
Travel Crash Rate (crashes/million veh-mi)	**1.16**
Travel FI Crash Rate (crashes/million veh-mi)	**0.34**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.82**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 5. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.1932**
Average Future Road AADT (vpd)	**95,062**
Predicted Crashes	
Total Crashes	**6.26**
Fatal and Injury Crashes	**2.01**
Property-Damage-Only Crashes	**4.25**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**32**
Percent Property-Damage-Only Crashes (%)	**68**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**32.4322**
FI Crash Rate (crashes/mi/yr)	**10.4116**
PDO Crash Rate (crashes/mi/yr)	**22.0206**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**6.70**
Travel Crash Rate (crashes/million veh-mi)	**0.94**
Travel FI Crash Rate (crashes/million veh-mi)	**0.30**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.64**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 6. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.01	0.2
Highway Segment	Other Multi-vehicle Collision	0.01	0.6	0.02	1.0	0.04	1.6
Highway Segment	Rear-end Collision	0.43	19.3	0.76	34.1	1.18	53.5
Highway Segment	Sideswipe, Same Direction Collision	0.10	4.7	0.36	16.2	0.46	21.0
Highway Segment	Total Multiple Vehicle Crashes	0.56	25.5	1.16	52.4	1.73	77.9
Highway Segment	Total Highway Segment Crashes	0.79	35.6	1.43	64.4	2.21	100.0
	Total Crashes	0.79	35.6	1.43	64.4	2.21	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 15. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1343+13.390	1345+47.920	Information: for segment #1 (1343+13.390 to 1345+47.920), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+13.390	1345+47.920	Information: for segment #1 (1343+13.390 to 1345+47.920), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+13.390	1345+47.920	Information: for segment #1 (1343+13.390 to 1345+47.920), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+13.390	1345+47.920	Information: for segment #1 (1343+13.390 to 1345+47.920), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+47.920	1345+73.390	Information: for segment #2 (1345+47.920 to 1345+73.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+47.920	1345+73.390	Information: for segment #2 (1345+47.920 to 1345+73.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+47.920	1345+73.390	Information: for segment #2 (1345+47.920 to 1345+73.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+47.920	1345+73.390	Information: for segment #2 (1345+47.920 to 1345+73.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+73.390	1346+07.390	Information: for segment #3 (1345+73.390 to 1346+07.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+73.390	1346+07.390	Information: for segment #3 (1345+73.390 to 1346+07.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+73.390	1346+07.390	Information: for segment #3 (1345+73.390 to 1346+07.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+73.390	1346+07.390	Warning: for segment #3 (1345+73.390 to 1346+07.390), Outside barrier offset (8.00 feet) is less than the left outside shoulder width (9.00 feet). This indicates there is problem with the input data.
1346+07.390	1346+23.390	Information: for segment #4 (1346+07.390 to 1346+23.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+07.390	1346+23.390	Information: for segment #4 (1346+07.390 to 1346+23.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+07.390	1346+23.390	Information: for segment #4 (1346+07.390 to 1346+23.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+07.390	1346+23.390	Information: for segment #4 (1346+07.390 to 1346+23.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+23.390	1346+47.920	Information: for segment #5 (1346+23.390 to 1346+47.920), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+23.390	1346+47.920	Information: for segment #5 (1346+23.390 to 1346+47.920), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+23.390	1346+47.920	Information: for segment #5 (1346+23.390 to 1346+47.920), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+23.390	1346+47.920	Information: for segment #5 (1346+23.390 to 1346+47.920), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+47.920	1349+58.530	Information: for segment #6 (1346+47.920 to 1349+58.530), Median barrier distance from edge of inside shoulder to barrier face (-0.01 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1346+47.920	1349+58.530	Information: for segment #6 (1346+47.920 to 1349+58.530), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1351+13.440	1351+81.390	Information: for segment #12 (1351+13.440 to 1351+81.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+13.440	1351+81.390	Information: for segment #12 (1351+13.440 to 1351+81.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+13.440	1351+81.390	Information: for segment #12 (1351+13.440 to 1351+81.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+13.440	1351+81.390	Information: for segment #12 (1351+13.440 to 1351+81.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+81.390	1353+18.390	Information: for segment #13 (1351+81.390 to 1353+18.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+81.390	1353+18.390	Information: for segment #13 (1351+81.390 to 1353+18.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+81.390	1353+18.390	Information: for segment #13 (1351+81.390 to 1353+18.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1351+81.390	1353+18.390	Information: for segment #13 (1351+81.390 to 1353+18.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+18.390	1353+72.910	Information: for segment #14 (1353+18.390 to 1353+72.910), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+18.390	1353+72.910	Information: for segment #14 (1353+18.390 to 1353+72.910), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+18.390	1353+72.910	Information: for segment #14 (1353+18.390 to 1353+72.910), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+18.390	1353+72.910	Information: for segment #14 (1353+18.390 to 1353+72.910), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+72.910	1354+00.500	Information: for segment #15 (1353+72.910 to 1354+00.500), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+72.910	1354+00.500	Information: for segment #15 (1353+72.910 to 1354+00.500), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+72.910	1354+00.500	Information: for segment #15 (1353+72.910 to 1354+00.500), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1353+72.910	1354+00.500	Information: for segment #15 (1353+72.910 to 1354+00.500), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1354+00.500	1360+45.180	Information: for segment #16 (1354+00.500 to 1360+45.180), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1354+00.500	1360+45.180	Information: for segment #16 (1354+00.500 to 1360+45.180), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1354+00.500	1360+45.180	Information: for segment #16 (1354+00.500 to 1360+45.180), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1354+00.500	1360+45.180	Information: for segment #16 (1354+00.500 to 1360+45.180), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Information: for segment #17 (1360+45.180 to 1361+05.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Information: for segment #17 (1360+45.180 to 1361+05.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1360+45.180	1361+05.390	Information: for segment #17 (1360+45.180 to 1361+05.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+45.180	1361+05.390	Warning: for segment #17 (1360+45.180 to 1361+05.390), Outside barrier offset (8.00 feet) is less than the left outside shoulder width (9.00 feet). This indicates there is problem with the input data.
1361+05.390	1375+07.630	Information: for segment #18 (1361+05.390 to 1375+07.630), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1361+05.390	1375+07.630	Information: for segment #18 (1361+05.390 to 1375+07.630), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1361+05.390	1375+07.630	Information: for segment #18 (1361+05.390 to 1375+07.630), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1361+05.390	1375+07.630	Information: for segment #18 (1361+05.390 to 1375+07.630), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1375+07.630	1377+39.570	Information: for segment #19 (1375+07.630 to 1377+39.570), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1375+07.630	1377+39.570	Information: for segment #19 (1375+07.630 to 1377+39.570), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1375+07.630	1377+39.570	Information: for segment #19 (1375+07.630 to 1377+39.570), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1375+07.630	1377+39.570	Information: for segment #19 (1375+07.630 to 1377+39.570), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1377+39.570	1387+63.390	Information: for segment #21 (1377+39.570 to 1387+63.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1377+39.570	1387+63.390	Information: for segment #21 (1377+39.570 to 1387+63.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1377+39.570	1387+63.390	Information: for segment #21 (1377+39.570 to 1387+63.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1377+39.570	1387+63.390	Information: for segment #21 (1377+39.570 to 1387+63.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1387+63.390	1393+33.520	Information: for segment #23 (1387+63.390 to 1393+33.520), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1387+63.390	1393+33.520	Information: for segment #23 (1387+63.390 to 1393+33.520), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1387+63.390	1393+33.520	Information: for segment #23 (1387+63.390 to 1393+33.520), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1387+63.390	1393+33.520	Information: for segment #23 (1387+63.390 to 1393+33.520), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1393+33.520	1395+79.430	Information: for segment #26 (1393+33.520 to 1395+79.430), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1393+33.520	1395+79.430	Information: for segment #26 (1393+33.520 to 1395+79.430), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1393+33.520	1395+79.430	Information: for segment #26 (1393+33.520 to 1395+79.430), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1393+33.520	1395+79.430	Information: for segment #26 (1393+33.520 to 1395+79.430), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1395+79.430	1402+90.080	Information: for segment #28 (1395+79.430 to 1402+90.080), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1086+14.425
Evaluation End Location: 1137+96.210
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

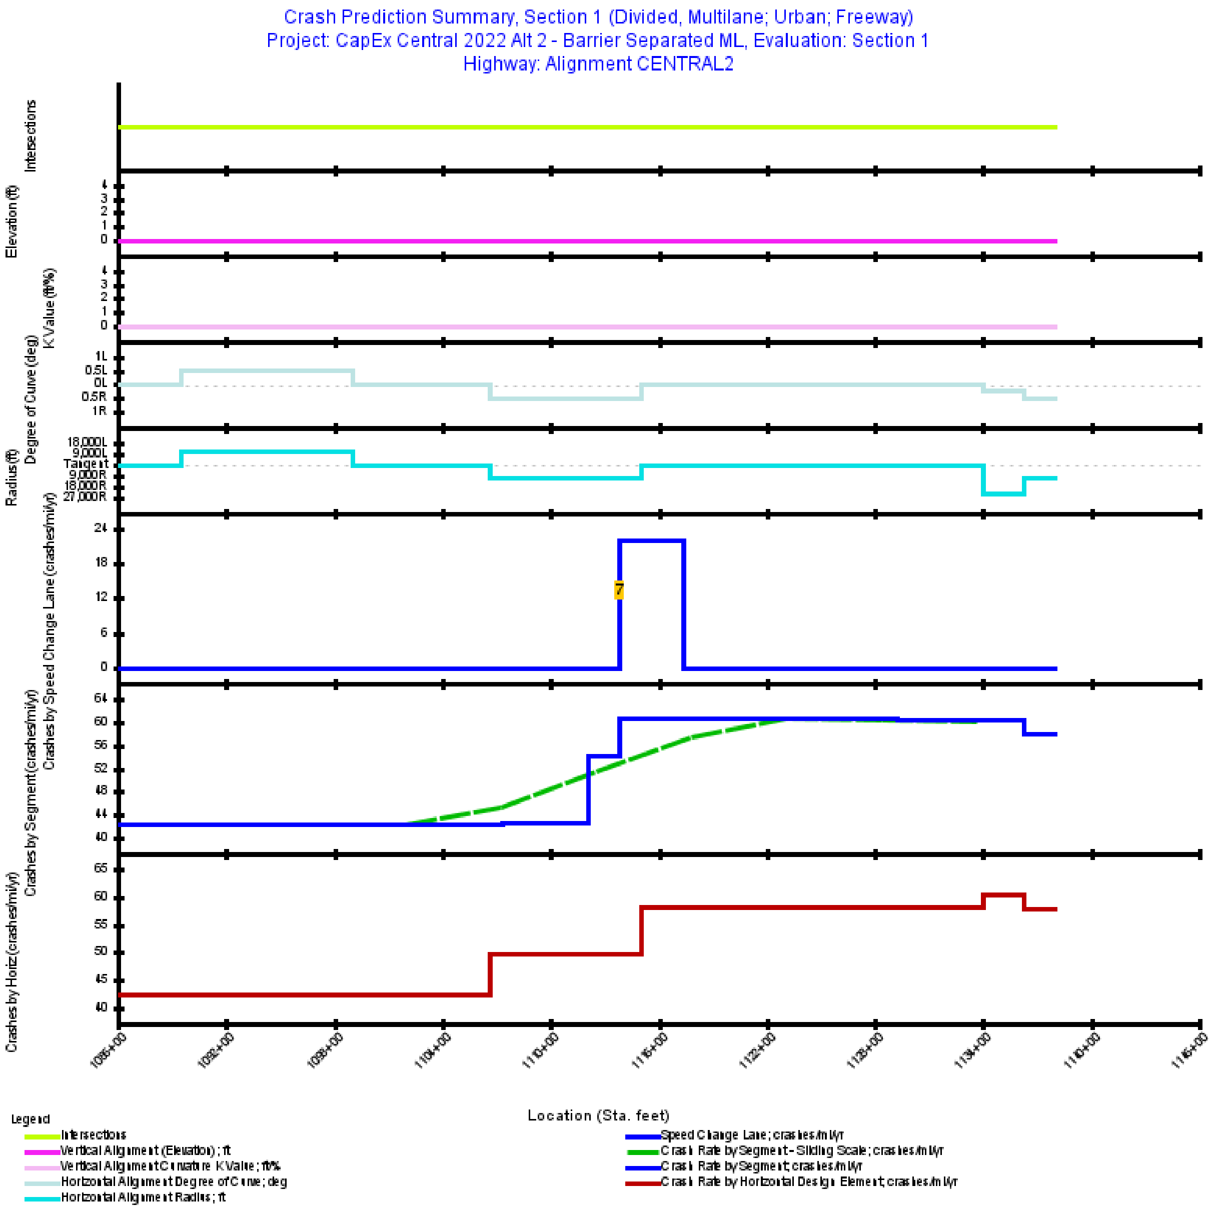

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Eight-lane Freeway	Urban	1086+14.425	1086+91.810	77.39	0.0147	2030: 129,550	86.53	Non-Traversable Median	94.42
2	Eight-lane Freeway	Urban	1086+91.810	1092+75.425	583.62	0.1105	2030: 129,550	91.03	Non-Traversable Median	99.03
3	Eight-lane Freeway	Urban	1092+75.425	1107+32.425	1,457.00	0.2759	2030: 129,550	96.00	Non-Traversable Median	103.00
4	Eight-lane Freeway	Urban	1107+32.425	1112+09.280	476.86	0.0903	2030: 129,550	92.98	Non-Traversable Median	100.98
5	Nine-lane Freeway	Urban	1112+09.280	1113+87.800	178.52	0.0338	2030: 151,450	90.22	Non-Traversable Median	98.22
6	Nine-lane Freeway	Urban	1113+87.800	1129+20.890	1,533.09	0.2904	2030: 169,950	88.00	Non-Traversable Median	96.73
8	Ten-lane Freeway	Urban	1129+20.890	1136+27.020	706.13	0.1337	2030: 175,750	88.00	Non-Traversable Median	96.00
9	Ten-lane Freeway	Urban	1136+27.020	1137+96.210	169.19	0.0320	2030: 175,750	88.00	Non-Traversable Median	95.68

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
7	Nine-lane Freeway Speed Change	Exit	1113+87.800	1117+37.800	350.00	0.0663	2030: 169,950	88.00	Non-Traversable Median	96.73

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.9483**
Average Future Road AADT (vpd)	**149,366**
Predicted Crashes	
Total Crashes	**48.19**
Fatal and Injury Crashes	**14.08**
Property-Damage-Only Crashes	**34.11**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**50.8237**
FI Crash Rate (crashes/mi/yr)	**14.8516**
PDO Crash Rate (crashes/mi/yr)	**35.9721**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**51.70**
Travel Crash Rate (crashes/million veh-mi)	**0.93**
Travel FI Crash Rate (crashes/million veh-mi)	**0.27**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.66**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0663**
Average Future Road AADT (vpd)	**84,975**
Predicted Crashes	
Total Crashes	**1.47**
Fatal and Injury Crashes	**0.44**
Property-Damage-Only Crashes	**1.02**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**22.0946**
FI Crash Rate (crashes/mi/yr)	**6.6599**
PDO Crash Rate (crashes/mi/yr)	**15.4347**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**2.06**
Travel Crash Rate (crashes/million veh-mi)	**0.71**
Travel FI Crash Rate (crashes/million veh-mi)	**0.21**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.50**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1086+14.425	1086+91.810	0.0147	0.618	0.6179	0.1834	0.4345	42.1588	0.89
2	1086+91.810	1092+75.425	0.1105	4.686	4.6865	1.3897	3.2968	42.3990	0.90
3	1092+75.425	1107+32.425	0.2759	11.690	11.6900	3.4668	8.2231	42.3631	0.90
4	1107+32.425	1112+09.280	0.0903	3.849	3.8493	1.1408	2.7085	42.6218	0.90
5	1112+09.280	1113+87.800	0.0338	1.835	1.8352	0.5401	1.2951	54.2776	0.98
6	1113+87.800	1129+20.890	0.2572	15.592	15.5918	4.4665	11.1253	60.6181	0.98
8	1129+20.890	1136+27.020	0.1337	8.070	8.0703	2.3561	5.7142	60.3447	0.94
9	1136+27.020	1137+96.210	0.0320	1.853	1.8529	0.5398	1.3131	57.8232	0.90
Total			0.9483	48.194	48.1938	14.0831	34.1107	50.8237	0.93

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 6. Predicted Crash Frequencies and Rates by Freeway Speed Change Lane (Speed Change)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
7	1113+87.800	1117+37.800	0.0663	1.465	1.4646	0.4415	1.0231	22.0946	0.71
Total			0.0663	1.465	1.4646	0.4415	1.0231	22.0946	0.71

Note: *Travel Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 7. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.02	1.1	0.02	1.6
Highway Segment	Rear-end Collision	0.24	16.5	0.58	39.5	0.82	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.07	4.8	0.14	9.6	0.21	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.33	22.3	0.75	51.2	1.08	73.5
Highway Segment	Total Highway Segment Crashes	0.44	30.1	1.02	69.9	1.47	100.0
	Total Crashes	0.44	30.1	1.02	69.9	1.47	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1086+14.425	1086+91.810	Information: for segment #1 (1086+14.425 to 1086+91.810), Effective median width (94.42 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1086+14.425	1086+91.810	Information: for segment #1 (1086+14.425 to 1086+91.810), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+14.425	1086+91.810	Information: for segment #1 (1086+14.425 to 1086+91.810), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+14.425	1086+91.810	Information: for segment #1 (1086+14.425 to 1086+91.810), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+14.425	1086+91.810	Information: for segment #1 (1086+14.425 to 1086+91.810), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+91.810	1092+75.425	Information: for segment #2 (1086+91.810 to 1092+75.425), Effective median width (99.03 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1086+91.810	1092+75.425	Information: for segment #2 (1086+91.810 to 1092+75.425), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+91.810	1092+75.425	Information: for segment #2 (1086+91.810 to 1092+75.425), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+91.810	1092+75.425	Information: for segment #2 (1086+91.810 to 1092+75.425), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1086+91.810	1092+75.425	Information: for segment #2 (1086+91.810 to 1092+75.425), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1092+75.425	1107+32.425	Information: for segment #3 (1092+75.425 to 1107+32.425), Effective median width (103.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1092+75.425	1107+32.425	Information: for segment #3 (1092+75.425 to 1107+32.425), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1092+75.425	1107+32.425	Information: for segment #3 (1092+75.425 to 1107+32.425), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1092+75.425	1107+32.425	Information: for segment #3 (1092+75.425 to 1107+32.425), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1092+75.425	1107+32.425	Information: for segment #3 (1092+75.425 to 1107+32.425), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1107+32.425	1112+09.280	Information: for segment #4 (1107+32.425 to 1112+09.280), Effective median width (100.98 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1107+32.425	1112+09.280	Information: for segment #4 (1107+32.425 to 1112+09.280), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1107+32.425	1112+09.280	Information: for segment #4 (1107+32.425 to 1112+09.280), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1107+32.425	1112+09.280	Information: for segment #4 (1107+32.425 to 1112+09.280), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1107+32.425	1112+09.280	Information: for segment #4 (1107+32.425 to 1112+09.280), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1112+09.280	1113+87.800	Information: for segment #5 (1112+09.280 to 1113+87.800), Effective median width (98.22 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1112+09.280	1113+87.800	Information: for segment #5 (1112+09.280 to 1113+87.800), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1112+09.280	1113+87.800	Information: for segment #5 (1112+09.280 to 1113+87.800), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1112+09.280	1113+87.800	Information: for segment #5 (1112+09.280 to 1113+87.800), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1112+09.280	1113+87.800	Information: for segment #5 (1112+09.280 to 1113+87.800), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+87.800	1129+20.890	Information: for segment #6 (1113+87.800 to 1129+20.890), Effective median width (96.73 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1113+87.800	1129+20.890	Information: for segment #6 (1113+87.800 to 1129+20.890), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+87.800	1129+20.890	Information: for segment #6 (1113+87.800 to 1129+20.890), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+87.800	1129+20.890	Information: for segment #6 (1113+87.800 to 1129+20.890), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+87.800	1129+20.890	Information: for segment #6 (1113+87.800 to 1129+20.890), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+20.890	1136+27.020	Information: for segment #8 (1129+20.890 to 1136+27.020), Effective median width (96.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1129+20.890	1136+27.020	Information: for segment #8 (1129+20.890 to 1136+27.020), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+20.890	1136+27.020	Information: for segment #8 (1129+20.890 to 1136+27.020), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+20.890	1136+27.020	Information: for segment #8 (1129+20.890 to 1136+27.020), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+20.890	1136+27.020	Information: for segment #8 (1129+20.890 to 1136+27.020), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1136+27.020	1137+96.210	Information: for segment #9 (1136+27.020 to 1137+96.210), Effective median width (95.68 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1136+27.020	1137+96.210	Information: for segment #9 (1136+27.020 to 1137+96.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1136+27.020	1137+96.210	Information: for segment #9 (1136+27.020 to 1137+96.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1136+27.020	1137+96.210	Information: for segment #9 (1136+27.020 to 1137+96.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1136+27.020	1137+96.210	Information: for segment #9 (1136+27.020 to 1137+96.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+87.800	1117+37.800	Information: for segment #7 (1113+87.800 to 1117+37.800), For Speed Change Lane the Effective median width (96.73 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1113+87.800	1117+37.800	Information: for segment #7 (1113+87.800 to 1117+37.800), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1112+09.280	1113+87.800	Information: for segment #5 (1112+09.280 to 1113+87.800), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1113+87.800	1129+20.890	Information: for segment #6 (1113+87.800 to 1129+20.890), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1113+87.800	1117+37.800	Information: for segment #7 (1113+87.800 to 1117+37.800), Speed Change Segment of type Nine-lane Freeway Speed Change is using unbalanced lane processing with types Eight-lane Freeway Speed Change and Ten-lane Freeway Speed Change

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 2
Evaluation Comment: Created Thu Jun 23 12:09:34 CDT 2022

Minimum Location: 1160+88.270
Maximum Location: 1181+39.215

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1160+88.270
Evaluation End Location: 1181+39.215
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

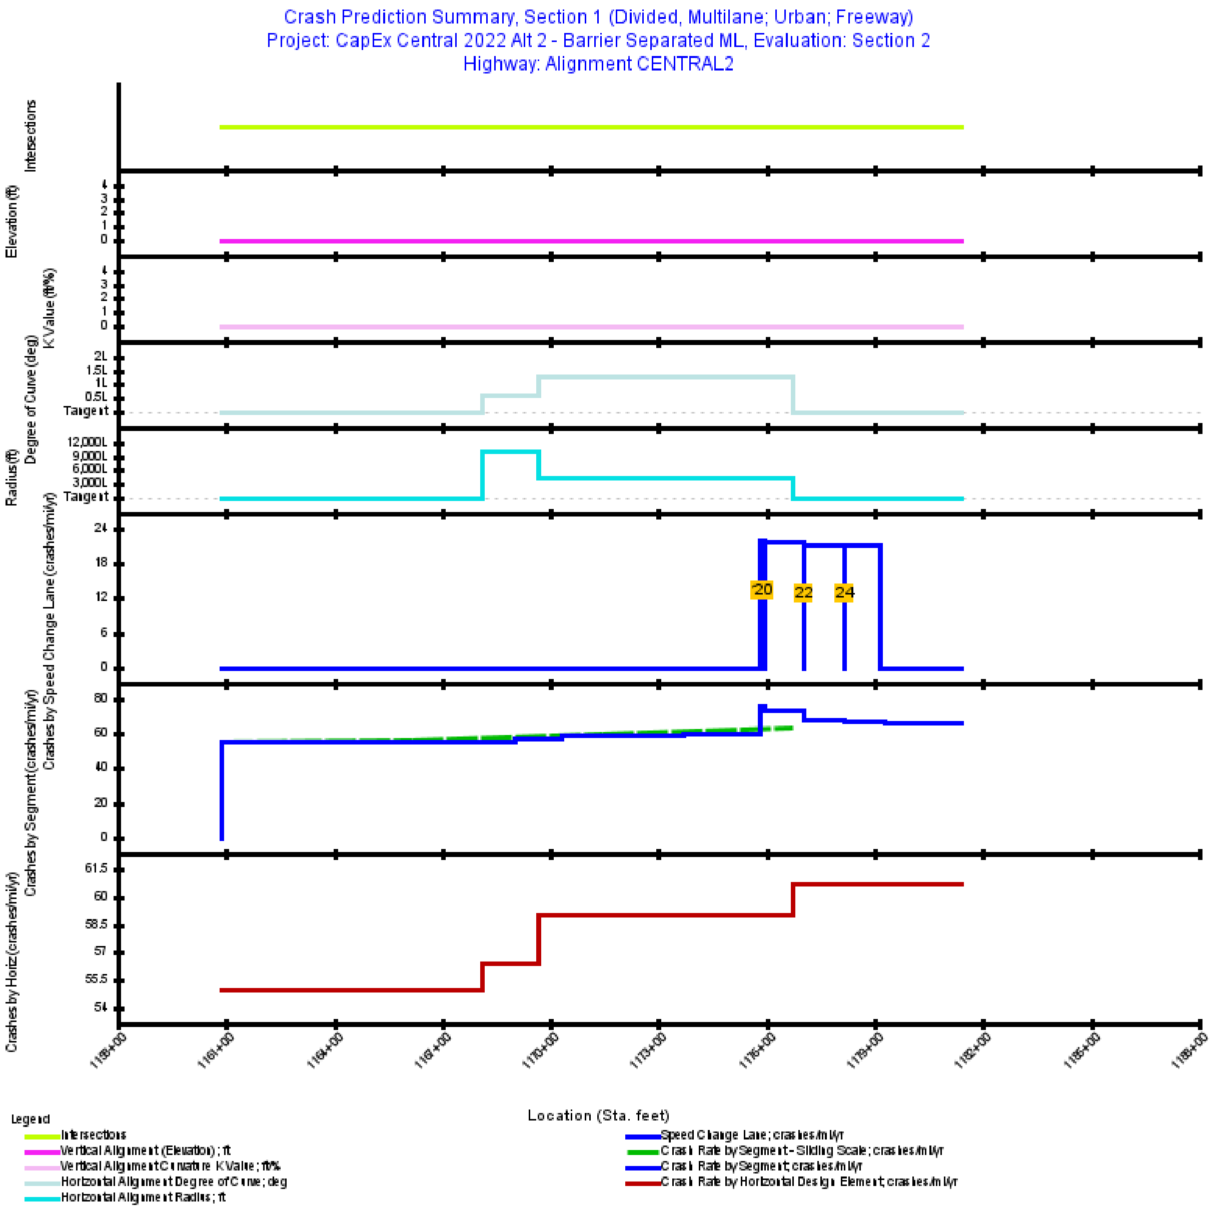

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Nine-lane Freeway	Urban	1160+88.270	1160+88.560	0.29	0.0001	2030: 159,500	88.01	Non-Traversable Median	95.92
2	Seven-lane Freeway	Urban	1160+88.560	1161+01.260	12.70	0.0024	2030: 151,150	88.63	Non-Traversable Median	96.58
3	Seven-lane Freeway	Urban	1161+01.260	1161+63.270	62.01	0.0117	2030: 151,150	92.16	Non-Traversable Median	100.16
4	Seven-lane Freeway	Urban	1161+63.270	1162+68.270	105.00	0.0199	2030: 151,150	100.05	Non-Traversable Median	108.05
5	Seven-lane Freeway	Urban	1162+68.270	1163+74.270	106.00	0.0201	2030: 151,150	110.03	Non-Traversable Median	118.03

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.3567**
Average Future Road AADT (vpd)	**153,327**
Predicted Crashes	
Total Crashes	**21.08**
Fatal and Injury Crashes	**5.73**
Property-Damage-Only Crashes	**15.35**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**27**
Percent Property-Damage-Only Crashes (%)	**73**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**59.1085**
FI Crash Rate (crashes/mi/yr)	**16.0738**
PDO Crash Rate (crashes/mi/yr)	**43.0347**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**19.96**
Travel Crash Rate (crashes/million veh-mi)	**1.06**
Travel FI Crash Rate (crashes/million veh-mi)	**0.29**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.77**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0634**
Average Future Road AADT (vpd)	**80,800**
Predicted Crashes	
Total Crashes	**1.36**
Fatal and Injury Crashes	**0.41**
Property-Damage-Only Crashes	**0.95**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**21.3700**
FI Crash Rate (crashes/mi/yr)	**6.4553**
PDO Crash Rate (crashes/mi/yr)	**14.9147**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**1.87**
Travel Crash Rate (crashes/million veh-mi)	**0.72**
Travel FI Crash Rate (crashes/million veh-mi)	**0.22**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.51**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	**Start Location (Sta. ft)**	**End Location (Sta. ft)**	**Effective Length (mi)**	**Total Predicted Crashes for Evaluation Period**	**Predicted Total Crash Frequency (crashes/yr)**	**Predicted FI Crash Frequency (crashes/yr)**	**Predicted PDO Crash Frequency (crashes/yr)**	**Predicted Crash Rate (crashes/mi/yr)**	**Predicted Travel Crash Rate (crashes/million veh-mi)**

Highway Segment	Head-on Collision	0.03	0.1	0.02	0.1	0.05	0.2
Highway Segment	Other Multi-vehicle Collision	0.12	0.5	0.23	1.1	0.35	1.6
Highway Segment	Rear-end Collision	2.78	13.2	6.67	31.6	9.45	44.8
Highway Segment	Sideswipe, Same Direction Collision	0.67	3.2	2.57	12.2	3.24	15.4
Highway Segment	Total Multiple Vehicle Crashes	3.71	17.6	9.66	45.8	13.37	63.4
Highway Segment	Total Highway Segment Crashes	5.73	27.2	15.35	72.8	21.08	100.0
	Total Crashes	5.73	27.2	15.35	72.8	21.08	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 12. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.01	0.5	0.01	0.5
Highway Segment	Collision with Fixed Object	0.08	5.9	0.20	14.4	0.28	20.4
Highway Segment	Collision with Other Object	0.01	0.5	0.03	2.1	0.04	2.6
Highway Segment	Other Single-vehicle Collision	0.02	1.5	0.02	1.6	0.04	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.11	7.9	0.25	18.6	0.36	26.5
Highway Segment	Right-Angle Collision	0.01	0.3	0.01	0.8	0.02	1.2
Highway Segment	Head-on Collision	0.00	0.2	0.00	0.1	0.00	0.3
Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.01	1.1	0.02	1.6
Highway Segment	Rear-end Collision	0.23	16.6	0.54	39.4	0.76	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.07	4.8	0.13	9.6	0.20	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.30	22.3	0.69	51.2	1.00	73.5
Highway Segment	Total Highway Segment Crashes	0.41	30.2	0.95	69.8	1.36	100.0
	Total Crashes	0.41	30.2	0.95	69.8	1.36	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1160+88.270	1160+88.560	Information: for segment #1 (1160+88.270 to 1160+88.560), Effective median width (95.92 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1160+88.270	1160+88.560	Information: for segment #1 (1160+88.270 to 1160+88.560), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.270	1160+88.560	Information: for segment #1 (1160+88.270 to 1160+88.560), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.270	1160+88.560	Information: for segment #1 (1160+88.270 to 1160+88.560), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.270	1160+88.560	Information: for segment #1 (1160+88.270 to 1160+88.560), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.560	1161+01.260	Information: for segment #2 (1160+88.560 to 1161+01.260), Effective median width (96.58 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1160+88.560	1161+01.260	Information: for segment #2 (1160+88.560 to 1161+01.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.560	1161+01.260	Information: for segment #2 (1160+88.560 to 1161+01.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.560	1161+01.260	Information: for segment #2 (1160+88.560 to 1161+01.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.560	1161+01.260	Information: for segment #2 (1160+88.560 to 1161+01.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+01.260	1161+63.270	Information: for segment #3 (1161+01.260 to 1161+63.270), Effective median width (100.16 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+01.260	1161+63.270	Information: for segment #3 (1161+01.260 to 1161+63.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+01.260	1161+63.270	Information: for segment #3 (1161+01.260 to 1161+63.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+01.260	1161+63.270	Information: for segment #3 (1161+01.260 to 1161+63.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+01.260	1161+63.270	Information: for segment #3 (1161+01.260 to 1161+63.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.270	1162+68.270	Information: for segment #4 (1161+63.270 to 1162+68.270), Effective median width (108.05 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+63.270	1162+68.270	Information: for segment #4 (1161+63.270 to 1162+68.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.270	1162+68.270	Information: for segment #4 (1161+63.270 to 1162+68.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.270	1162+68.270	Information: for segment #4 (1161+63.270 to 1162+68.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.270	1162+68.270	Information: for segment #4 (1161+63.270 to 1162+68.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+68.270	1163+74.270	Information: for segment #5 (1162+68.270 to 1163+74.270), Effective median width (118.03 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1162+68.270	1163+74.270	Information: for segment #5 (1162+68.270 to 1163+74.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+68.270	1163+74.270	Information: for segment #5 (1162+68.270 to 1163+74.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+68.270	1163+74.270	Information: for segment #5 (1162+68.270 to 1163+74.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1162+68.270	1163+74.270	Information: for segment #5 (1162+68.270 to 1163+74.270), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1163+74.270	1164+80.270	Information: for segment #6 (1163+74.270 to 1164+80.270), Effective median width (128.05 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1163+74.270	1164+80.270	Information: for segment #6 (1163+74.270 to 1164+80.270), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1178+15.270	1179+14.320	Information: for segment #24 (1178+15.270 to 1179+14.320), For Speed Change Lane the Effective median width (98.56 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1178+15.270	1179+14.320	Information: for segment #24 (1178+15.270 to 1179+14.320), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+88.270	1160+88.560	Information: for segment #1 (1160+88.270 to 1160+88.560), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1160+88.560	1161+01.260	Information: for segment #2 (1160+88.560 to 1161+01.260), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1161+01.260	1161+63.270	Information: for segment #3 (1161+01.260 to 1161+63.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1161+63.270	1162+68.270	Information: for segment #4 (1161+63.270 to 1162+68.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1162+68.270	1163+74.270	Information: for segment #5 (1162+68.270 to 1163+74.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1163+74.270	1164+80.270	Information: for segment #6 (1163+74.270 to 1164+80.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1164+80.270	1165+86.270	Information: for segment #7 (1164+80.270 to 1165+86.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1165+86.270	1166+91.270	Information: for segment #8 (1165+86.270 to 1166+91.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1166+91.270	1167+97.270	Information: for segment #9 (1166+91.270 to 1167+97.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1167+97.270	1169+03.270	Information: for segment #10 (1167+97.270 to 1169+03.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1169+03.270	1170+33.270	Information: for segment #11 (1169+03.270 to 1170+33.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1170+33.270	1171+45.270	Information: for segment #12 (1170+33.270 to 1171+45.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1171+45.270	1172+57.270	Information: for segment #13 (1171+45.270 to 1172+57.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1172+57.270	1173+69.270	Information: for segment #14 (1172+57.270 to 1173+69.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1173+69.270	1174+80.270	Information: for segment #15 (1173+69.270 to 1174+80.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1174+80.270	1175+79.320	Information: for segment #16 (1174+80.270 to 1175+79.320), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1175+79.320	1175+92.270	Information: for segment #17 (1175+79.320 to 1175+92.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1175+92.270	1177+04.270	Information: for segment #19 (1175+92.270 to 1177+04.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1177+04.270	1178+15.270	Information: for segment #21 (1177+04.270 to 1178+15.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1178+15.270	1179+27.270	Information: for segment #23 (1178+15.270 to 1179+27.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1179+27.270	1180+39.270	Information: for segment #25 (1179+27.270 to 1180+39.270), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1180+39.270	1181+39.215	Information: for segment #26 (1180+39.270 to 1181+39.215), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1175+79.320	1175+92.270	Information: for segment #18 (1175+79.320 to 1175+92.270), Speed Change Segment of type Seven-lane Freeway Speed Change is using unbalanced lane processing with types Six-lane Freeway Speed Change and Eight-lane Freeway Speed Change
1175+92.270	1177+04.270	Information: for segment #20 (1175+92.270 to 1177+04.270), Speed Change Segment of type Seven-lane Freeway Speed Change is using unbalanced lane processing with types Six-lane Freeway Speed Change and Eight-lane Freeway Speed Change
1177+04.270	1178+15.270	Information: for segment #22 (1177+04.270 to 1178+15.270), Speed Change Segment of type Seven-lane Freeway Speed Change is using unbalanced lane processing with types Six-lane Freeway Speed Change and Eight-lane Freeway Speed Change
1178+15.270	1179+14.320	Information: for segment #24 (1178+15.270 to 1179+14.320), Speed Change Segment of type Seven-lane Freeway Speed Change is using unbalanced lane processing with types Six-lane Freeway Speed Change and Eight-lane Freeway Speed Change

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 24, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Phone:
E-Mail:

Project Title: CapEx Central 2022 Alt 2 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL2
Highway Comment: Imported from CENTRAL2.xml
Highway Version: 1

Evaluation Title: Section 3
Evaluation Comment: Created Thu Jun 23 12:10:44 CDT 2022

Minimum Location: 1301+70.260
Maximum Location: 1343+13.390

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1301+70.260
Evaluation End Location: 1343+13.390
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_MV=1.0; FI_SV=1.0; PDO_MV=1.0; PDO_SV=1.0;

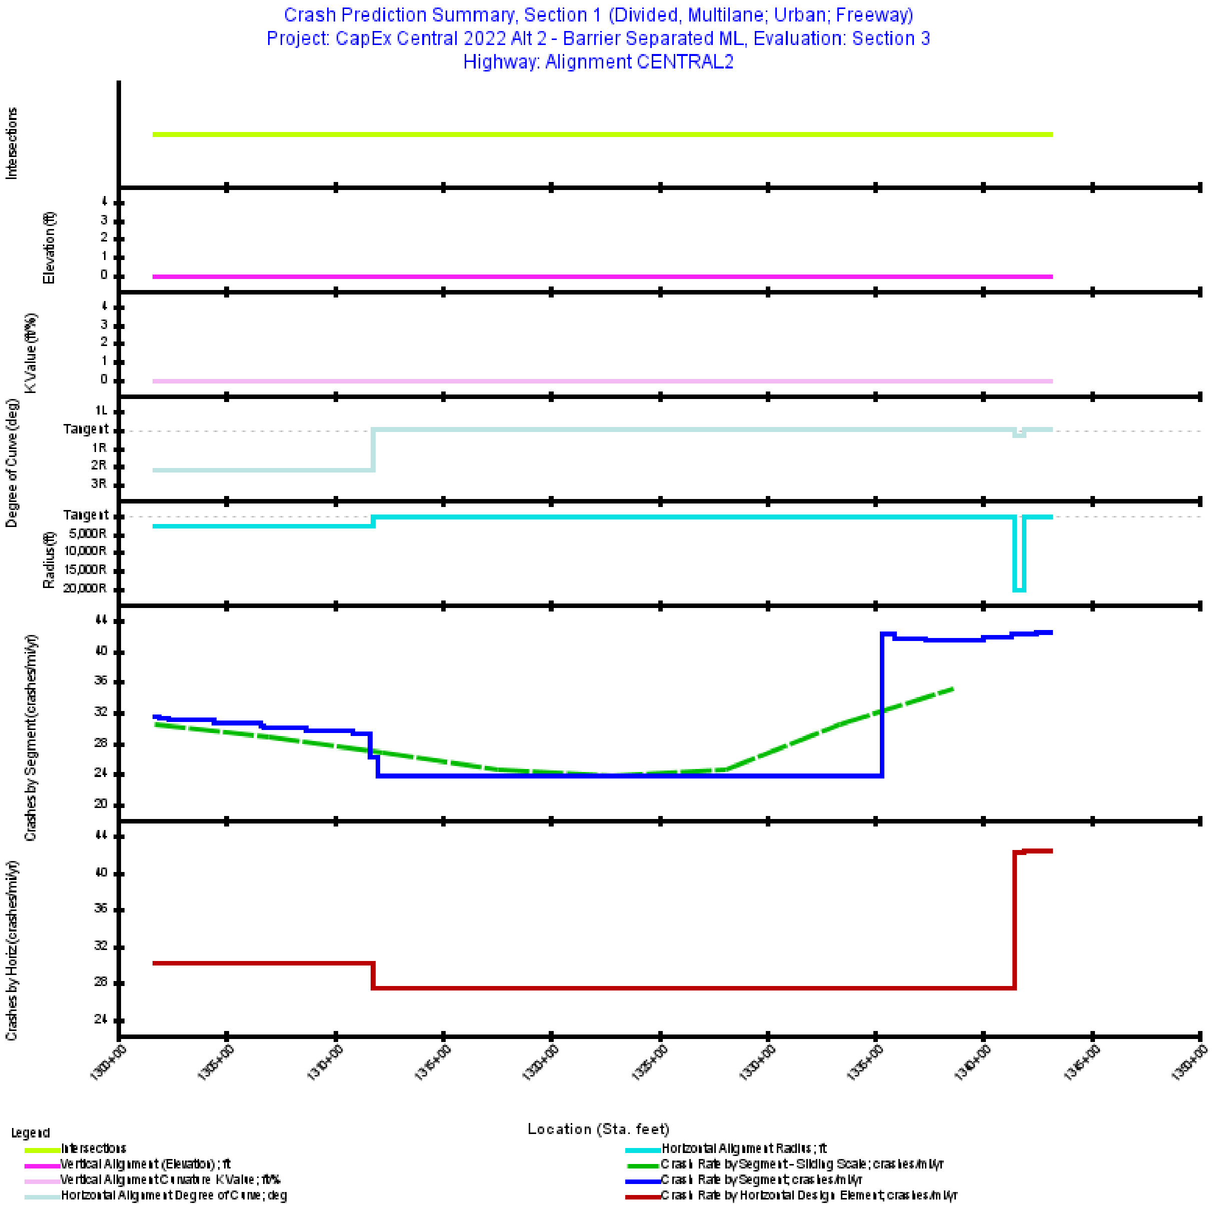

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Six-lane Freeway	Urban	1301+70.260	1301+89.180	18.92	0.0036	2030: 85,700	80.09	Non-Traversable Median	90.67
2	Six-lane Freeway	Urban	1301+89.180	1302+31.260	42.08	0.0080	2030: 85,700	80.40	Non-Traversable Median	91.20
3	Six-lane Freeway	Urban	1302+31.260	1304+44.260	213.00	0.0403	2030: 85,700	81.66	Non-Traversable Median	93.67
4	Six-lane Freeway	Urban	1304+44.260	1306+57.260	213.00	0.0403	2030: 85,700	83.78	Non-Traversable Median	97.78
5	Six-lane Freeway	Urban	1306+57.260	1306+74.260	17.00	0.0032	2030: 85,700	84.92	Non-Traversable Median	100.00
6	Six-lane Freeway	Urban	1306+74.260	1308+70.260	196.00	0.0371	2030: 85,700	85.98	Non-Traversable Median	102.06
7	Six-lane Freeway	Urban	1308+70.260	1310+83.260	213.00	0.0403	2030: 85,700	88.01	Non-Traversable Median	106.01
8	Six-lane Freeway	Urban	1310+83.260	1311+65.810	82.55	0.0156	2030: 85,700	89.47	Non-Traversable Median	108.86
9	Six-lane Freeway	Urban	1311+65.810	1312+03.280	37.47	0.0071	2030: 85,700	90.00	Non-Traversable Median	109.83
10	Six-lane Freeway	Urban	1312+03.280	1335+34.220	2,330.94	0.4415	2030: 85,700	90.00	Non-Traversable Median	110.00
11	Eight-lane Freeway	Urban	1335+34.220	1335+87.780	53.56	0.0101	2030: 132,350	90.00	Non-Traversable Median	110.00
12	Eight-lane Freeway	Urban	1335+87.780	1337+34.190	146.41	0.0277	2030: 132,350	90.00	Non-Traversable Median	109.59
13	Eight-lane Freeway	Urban	1337+34.190	1337+45.260	11.07	0.0021	2030: 132,350	89.84	Non-Traversable Median	108.92
14	Eight-lane Freeway	Urban	1337+45.260	1338+74.260	129.00	0.0244	2030: 132,350	87.78	Non-Traversable Median	105.78

19	Eight-lane Freeway	Urban	1342+45.260	1342+59.260	14.00	0.0027	2030: 132,350	74.79	Non-Traversable Median	85.90
20	Eight-lane Freeway	Urban	1342+59.260	1343+13.390	54.13	0.0103	2030: 132,350	73.79	Non-Traversable Median	84.37

Table 2. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.7847**
Average Future Road AADT (vpd)	**94,473**
Predicted Crashes	
Total Crashes	**22.61**
Fatal and Injury Crashes	**6.62**
Property-Damage-Only Crashes	**15.99**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**28.8142**
FI Crash Rate (crashes/mi/yr)	**8.4304**
PDO Crash Rate (crashes/mi/yr)	**20.3837**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**27.06**
Travel Crash Rate (crashes/million veh-mi)	**0.84**
Travel FI Crash Rate (crashes/million veh-mi)	**0.24**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.59**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 3. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1301+70.260	1301+89.180	0.0036	0.113	0.1126	0.0329	0.0797	31.4267	1.00

15	1338+74.260	1339+05.260	0.0059	0.243	0.2433	0.0700	0.1733	41.4446	0.86
16	1339+05.260	1340+02.260	0.0184	0.763	0.7633	0.2197	0.5436	41.5478	0.86
17	1340+02.260	1341+31.260	0.0244	1.022	1.0215	0.2943	0.7272	41.8104	0.87
18	1341+31.260	1342+45.260	0.0216	0.912	0.9121	0.2630	0.6491	42.2437	0.87
19	1342+45.260	1342+59.260	0.0027	0.113	0.1125	0.0325	0.0800	42.4225	0.88
20	1342+59.260	1343+13.390	0.0103	0.436	0.4363	0.1259	0.3104	42.5576	0.88
Total			0.7847	22.610	22.6100	6.6152	15.9948	28.8142	0.84

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 4. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
Simple Curve 1	1301+70.260	1311+82.312	0.1917	5.800	5.7997	1.6920	4.1077	30.2578	0.97
Tangent	1311+82.312	1341+45.042	0.5611	15.460	15.4597	4.5337	10.9261	27.5514	0.78
Simple Curve 2	1341+45.042	1341+85.312	0.0076	0.322	0.3222	0.0929	0.2293	42.2437	0.87
Tangent	1341+85.312	1343+13.390	0.0243	1.028	1.0284	0.2967	0.7317	42.3959	0.88

Table 5. Predicted Crash Frequencies by Year (Section 1)

Year	Total Crashes	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)
2030	22.61	6.62	29.258	15.99	70.742
Total	22.61	6.62	29.258	15.99	70.742
Average	22.61	6.62	29.258	15.99	70.742

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 6. Predicted Crash Severity by Freeway Segment (Section 1)

Seg. No.	Fatal (K) Crashes (crashes)	Incapacitating Injury (A) Crashes (crashes)	Non-Incapacitating Injury (B) Crashes (crashes)	Possible Injury (C) Crashes (crashes)	No Injury (O) Crashes (crashes)
1	0.0008	0.0016	0.0111	0.0194	0.0797
2	0.0017	0.0036	0.0247	0.0431	0.1769
3	0.0086	0.0182	0.1238	0.2159	0.8871

18	0.0056	0.0116	0.0848	0.1610	0.6491
19	0.0007	0.0013	0.0102	0.0203	0.0800
20	0.0025	0.0052	0.0396	0.0786	0.3104
Total	0.1396	0.2876	2.1201	4.0679	15.9948

Table 7. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.01	0.1	0.17	0.8	0.18	0.8
Highway Segment	Collision with Fixed Object	2.18	9.7	5.64	24.9	7.82	34.6
Highway Segment	Collision with Other Object	0.15	0.7	1.09	4.8	1.25	5.5
Highway Segment	Other Single-vehicle Collision	0.63	2.8	0.84	3.7	1.47	6.5
Highway Segment	Collision with Parked Vehicle	0.04	0.2	0.13	0.6	0.17	0.8
Highway Segment	Total Single Vehicle Crashes	3.02	13.4	7.87	34.8	10.90	48.2
Highway Segment	Right-Angle Collision	0.11	0.5	0.15	0.6	0.26	1.1
Highway Segment	Head-on Collision	0.03	0.1	0.02	0.1	0.04	0.2
Highway Segment	Other Multi-vehicle Collision	0.11	0.5	0.20	0.9	0.31	1.4
Highway Segment	Rear-end Collision	2.69	11.9	5.60	24.8	8.30	36.7
Highway Segment	Sideswipe, Same Direction Collision	0.65	2.9	2.16	9.6	2.81	12.4
Highway Segment	Total Multiple Vehicle Crashes	3.59	15.9	8.12	35.9	11.71	51.8
Highway Segment	Total Highway Segment Crashes	6.62	29.3	15.99	70.7	22.61	100.0
	Total Crashes	6.62	29.3	15.99	70.7	22.61	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 8. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1301+70.260	1301+89.180	Information: for segment #1 (1301+70.260 to 1301+89.180), Effective median width (90.67 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1301+70.260	1301+89.180	Information: for segment #1 (1301+70.260 to 1301+89.180), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+70.260	1301+89.180	Information: for segment #1 (1301+70.260 to 1301+89.180), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+70.260	1301+89.180	Information: for segment #1 (1301+70.260 to 1301+89.180), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+70.260	1301+89.180	Information: for segment #1 (1301+70.260 to 1301+89.180), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+89.180	1302+31.260	Information: for segment #2 (1301+89.180 to 1302+31.260), Effective median width (91.20 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1301+89.180	1302+31.260	Information: for segment #2 (1301+89.180 to 1302+31.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+89.180	1302+31.260	Information: for segment #2 (1301+89.180 to 1302+31.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+89.180	1302+31.260	Information: for segment #2 (1301+89.180 to 1302+31.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1301+89.180	1302+31.260	Information: for segment #2 (1301+89.180 to 1302+31.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1302+31.260	1304+44.260	Information: for segment #3 (1302+31.260 to 1304+44.260), Effective median width (93.67 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1302+31.260	1304+44.260	Information: for segment #3 (1302+31.260 to 1304+44.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1302+31.260	1304+44.260	Information: for segment #3 (1302+31.260 to 1304+44.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1302+31.260	1304+44.260	Information: for segment #3 (1302+31.260 to 1304+44.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1302+31.260	1304+44.260	Information: for segment #3 (1302+31.260 to 1304+44.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1304+44.260	1306+57.260	Information: for segment #4 (1304+44.260 to 1306+57.260), Effective median width (97.78 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1304+44.260	1306+57.260	Information: for segment #4 (1304+44.260 to 1306+57.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1304+44.260	1306+57.260	Information: for segment #4 (1304+44.260 to 1306+57.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1304+44.260	1306+57.260	Information: for segment #4 (1304+44.260 to 1306+57.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1304+44.260	1306+57.260	Information: for segment #4 (1304+44.260 to 1306+57.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1306+57.260	1306+74.260	Information: for segment #5 (1306+57.260 to 1306+74.260), Effective median width (100.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1306+57.260	1306+74.260	Information: for segment #5 (1306+57.260 to 1306+74.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1306+57.260	1306+74.260	Information: for segment #5 (1306+57.260 to 1306+74.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1306+57.260	1306+74.260	Information: for segment #5 (1306+57.260 to 1306+74.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1306+57.260	1306+74.260	Information: for segment #5 (1306+57.260 to 1306+74.260), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1306+74.260	1308+70.260	Information: for segment #6 (1306+74.260 to 1308+70.260), Effective median width (102.06 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1306+74.260	1308+70.260	Information: for segment #6 (1306+74.260 to 1308+70.260), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1342+59.260	1343+13.390	Information: for segment #20 (1342+59.260 to 1343+13.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+59.260	1343+13.390	Information: for segment #20 (1342+59.260 to 1343+13.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+59.260	1343+13.390	Information: for segment #20 (1342+59.260 to 1343+13.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+59.260	1343+13.390	Information: for segment #20 (1342+59.260 to 1343+13.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1335+34.220	1335+87.780	Warning: for segment #11 (1335+34.220 to 1335+87.780), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1335+87.780	1337+34.190	Warning: for segment #12 (1335+87.780 to 1337+34.190), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1337+34.190	1337+45.260	Warning: for segment #13 (1337+34.190 to 1337+45.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1337+45.260	1338+74.260	Warning: for segment #14 (1337+45.260 to 1338+74.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1338+74.260	1339+05.260	Warning: for segment #15 (1338+74.260 to 1339+05.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1339+05.260	1340+02.260	Warning: for segment #16 (1339+05.260 to 1340+02.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1340+02.260	1341+31.260	Warning: for segment #17 (1340+02.260 to 1341+31.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1341+31.260	1342+45.260	Warning: for segment #18 (1341+31.260 to 1342+45.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1342+45.260	1342+59.260	Warning: for segment #19 (1342+45.260 to 1342+59.260), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1342+59.260	1343+13.390	Warning: for segment #20 (1342+59.260 to 1343+13.390), Freeway Segment of type 8F is using unbalanced lane processing with 5 + 3 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment MLNB12
Highway Comment: Imported from MLNB12.xml
Highway Version: 1

Evaluation Title: Evaluation 2
Evaluation Comment: Created Thu Jun 23 10:45:26 CDT 2022

Minimum Location: 1000+00.000
Maximum Location: 1049+35.160

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1049+35.160
Functional Class: Freeway C-D Road & System Ramp
Type of Alignment: One Direction
Model Category: C-D Road & System Ramp
Calibration Factor: CD_MV_FI=1.0; CD_MV_PDO=1.0; CD_SV_FI=1.0; CD_SV_PDO=1.0;

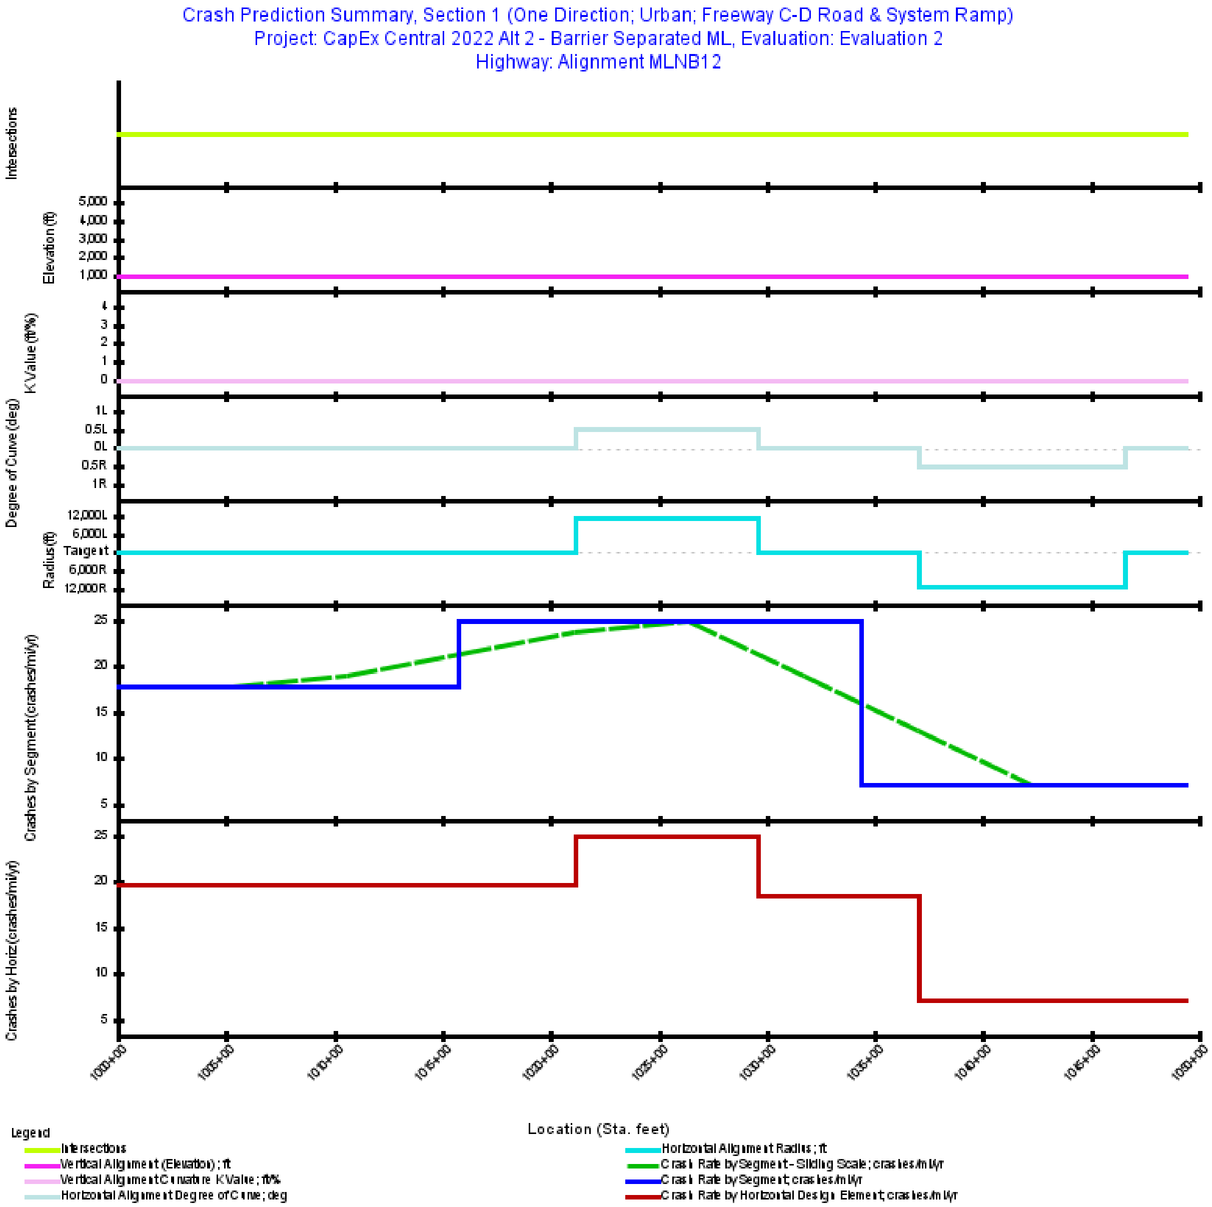

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT
1	Freeway Ramp and C-D Road Two-lane C-D Ramp	Urban	1000+00.000	1015+73.000	1,573.00	0.2979	2030: 23,100
2	Freeway Ramp and C-D Road Two-lane C-D Ramp	Urban	1015+73.000	1034+35.000	1,862.00	0.3527	2030: 25,350
3	Freeway Ramp and C-D Road Two-lane C-D Ramp	Urban	1034+35.000	1049+35.160	1,500.16	0.2841	2030: 14,500

Table 2. User Defined CMF Used in the Eval Segment CPM Evaluation (Freeway Ramp Sections)

Name	Description	Start Loc. (Sta. ft)	End Loc. (Sta. ft)	Start CMF Year	End CMF Year	Severity	CMF Value
3 lanes	3/2	1015+72.450	1034+34.630	2030	2050	Total	1.5000

Table 3. Predicted Ramp Crash Rates and Frequencies Summary (Freeway Ramp Sections)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Highway Segment	Total Multiple Vehicle Crashes	1.19	23.0	2.75	53.4	3.93	76.5
Highway Segment	Total Highway Segment Crashes	1.68	32.7	3.46	67.3	5.14	100.0
	Total Crashes	1.68	32.7	3.46	67.3	5.14	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 2 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:24:11 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment MLSB12
Highway Comment: Imported from MLSB12.xml
Highway Version: 1

Evaluation Title: Evaluation 1
Evaluation Comment: Created Thu Jun 23 10:49:08 CDT 2022

Minimum Location: 1000+00.000
Maximum Location: 1054+28.200

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1054+28.200
Functional Class: Freeway C-D Road & System Ramp
Type of Alignment: One Direction
Model Category: C-D Road & System Ramp
Calibration Factor: CD_MV_FI=1.0; CD_MV_PDO=1.0; CD_SV_FI=1.0; CD_SV_PDO=1.0;

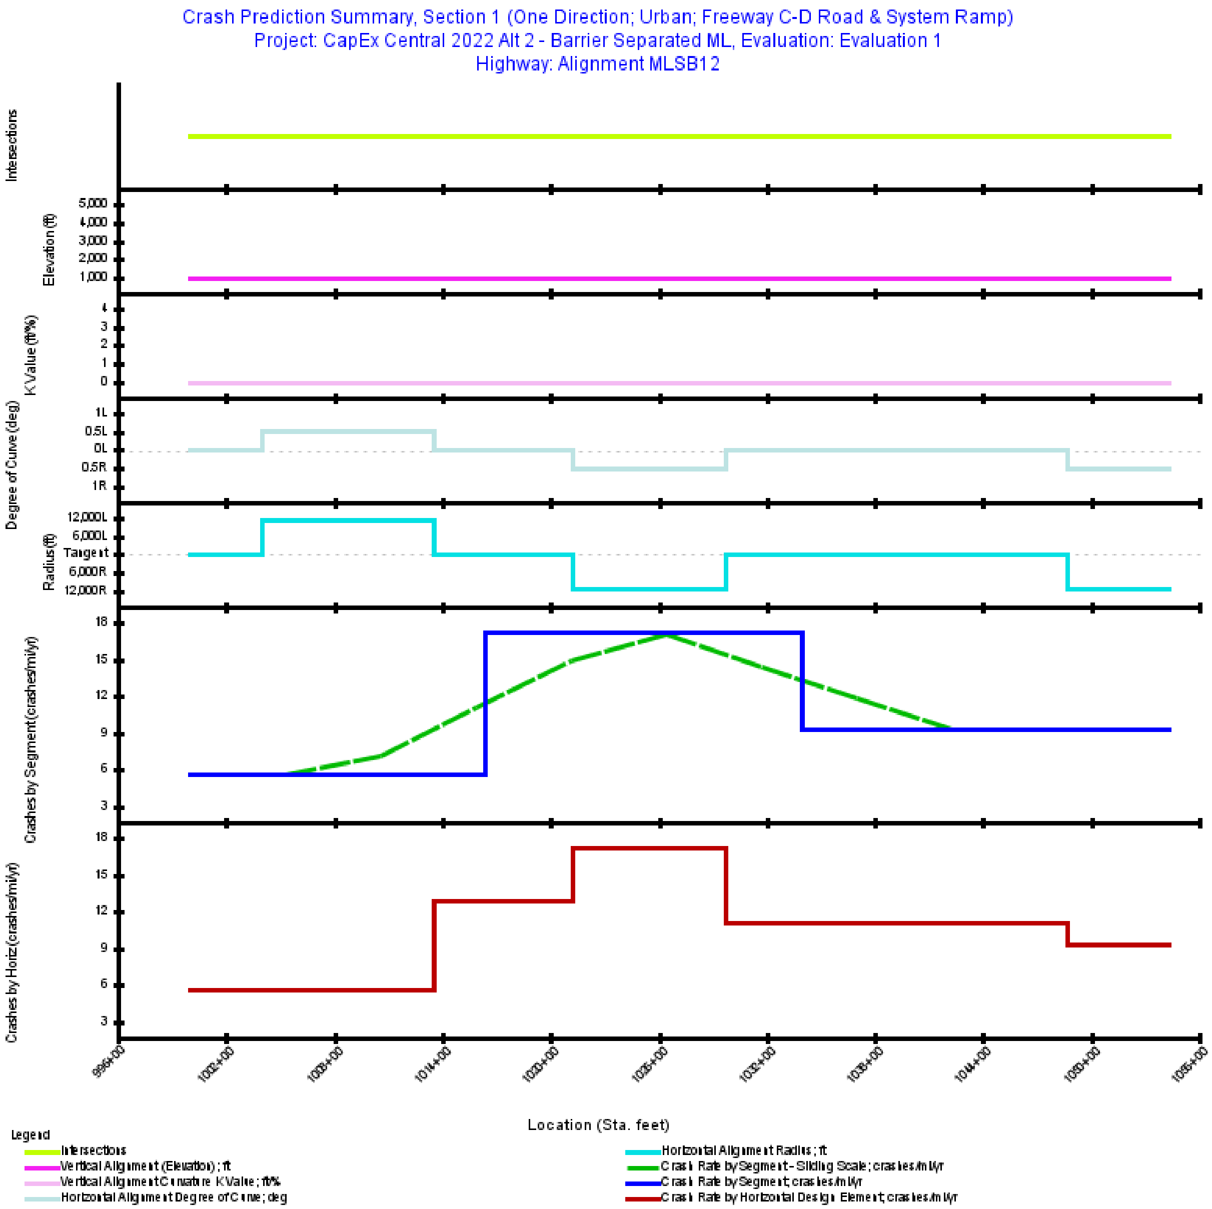

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1028+85.965
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: EX_RAMP_MV_FI=1.0; EX_RAMP_MV_PDO=1.0; EX_RAMP_SV_FI=1.0; EX_RAMP_SV_PDO=1.0;

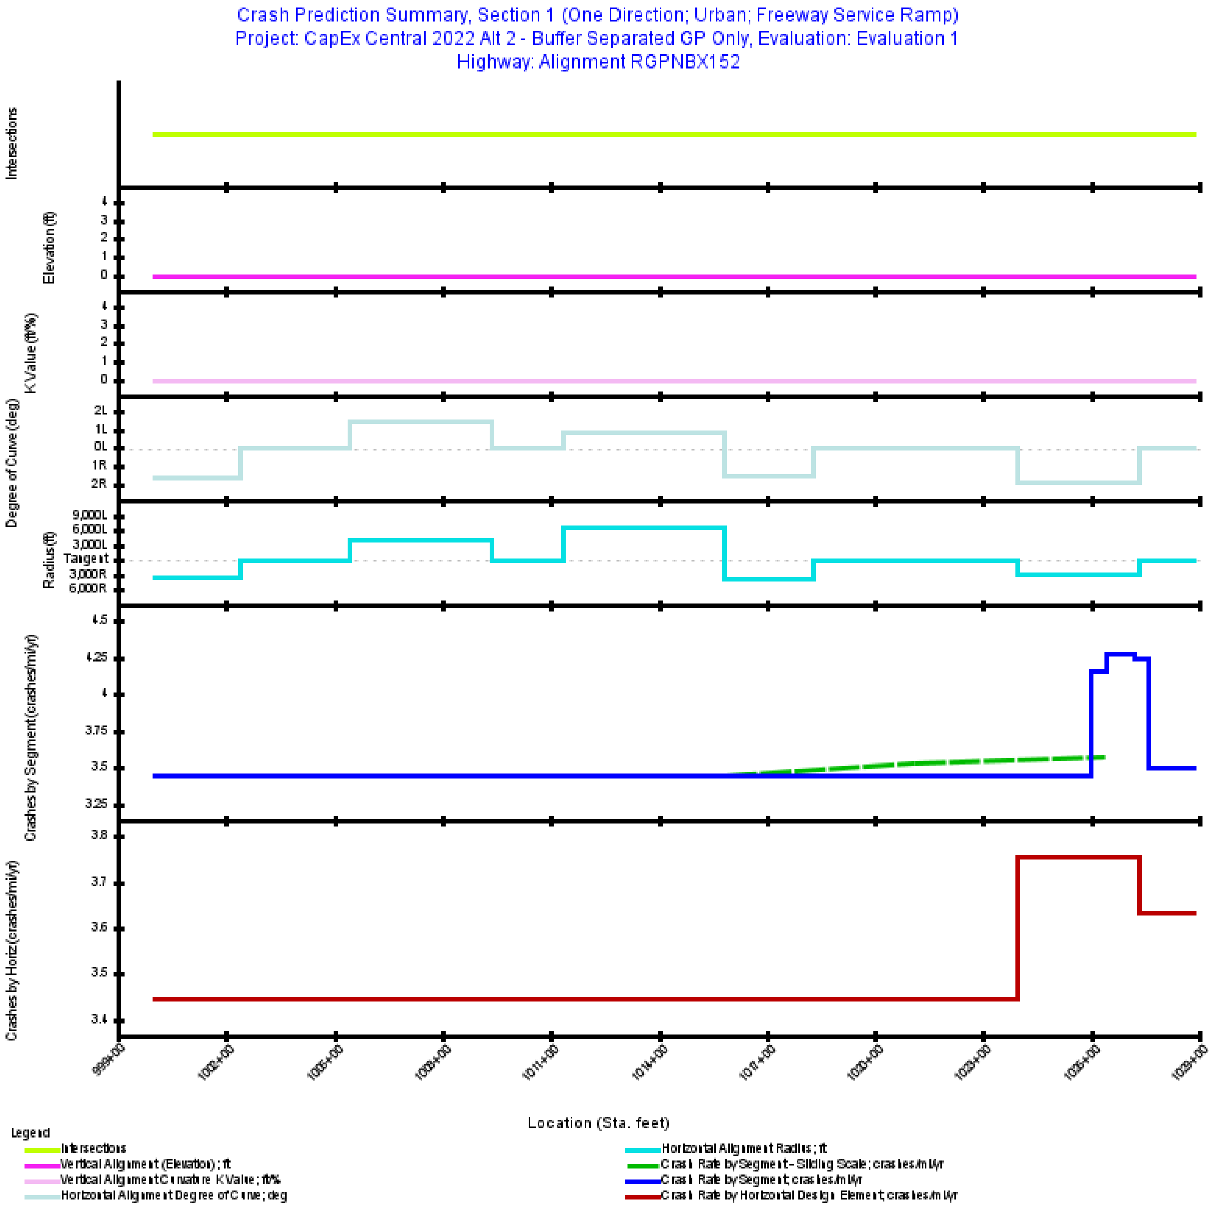

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1005+97.108
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: ENT_RAMP_MV_FI=1.0; ENT_RAMP_MV_PDO=1.0; ENT_RAMP_SV_FI=1.0; ENT_RAMP_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1010+50.147
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: ENT_RAMP_MV_FI=1.0; ENT_RAMP_MV_PDO=1.0; ENT_RAMP_SV_FI=1.0; ENT_RAMP_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1003+71.453
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: EX_RAMP_MV_FI=1.0; EX_RAMP_MV_PDO=1.0; EX_RAMP_SV_FI=1.0; EX_RAMP_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

1006+38.000	1006+95.123	Warning: for segment #7 (1006+38.000 to 1006+95.123), traffic volume (32,400 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1017+35.175
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: ENT_RAMP_MV_FI=1.0; ENT_RAMP_MV_PDO=1.0; ENT_RAMP_SV_FI=1.0; ENT_RAMP_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

1049+67.120	1050+92.000	Information: for segment #7 (1049+67.120 to 1050+92.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1049+67.120	1050+92.000	Information: for segment #7 (1049+67.120 to 1050+92.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1050+92.000	1054+22.000	Information: for segment #8 (1050+92.000 to 1054+22.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1050+92.000	1054+22.000	Information: for segment #8 (1050+92.000 to 1054+22.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1050+92.000	1054+22.000	Information: for segment #8 (1050+92.000 to 1054+22.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1050+92.000	1054+22.000	Information: for segment #8 (1050+92.000 to 1054+22.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1054+22.000	1055+87.420	Information: for segment #9 (1054+22.000 to 1055+87.420), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1054+22.000	1055+87.420	Information: for segment #9 (1054+22.000 to 1055+87.420), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1054+22.000	1055+87.420	Information: for segment #9 (1054+22.000 to 1055+87.420), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1054+22.000	1055+87.420	Information: for segment #9 (1054+22.000 to 1055+87.420), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+79.090	1023+40.350	Information: for segment #3 (1019+79.090 to 1023+40.350), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 2
Evaluation Comment: Created Thu Jun 23 12:21:37 CDT 2022

Minimum Location: 1137+45.515
Maximum Location: 1161+05.035

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

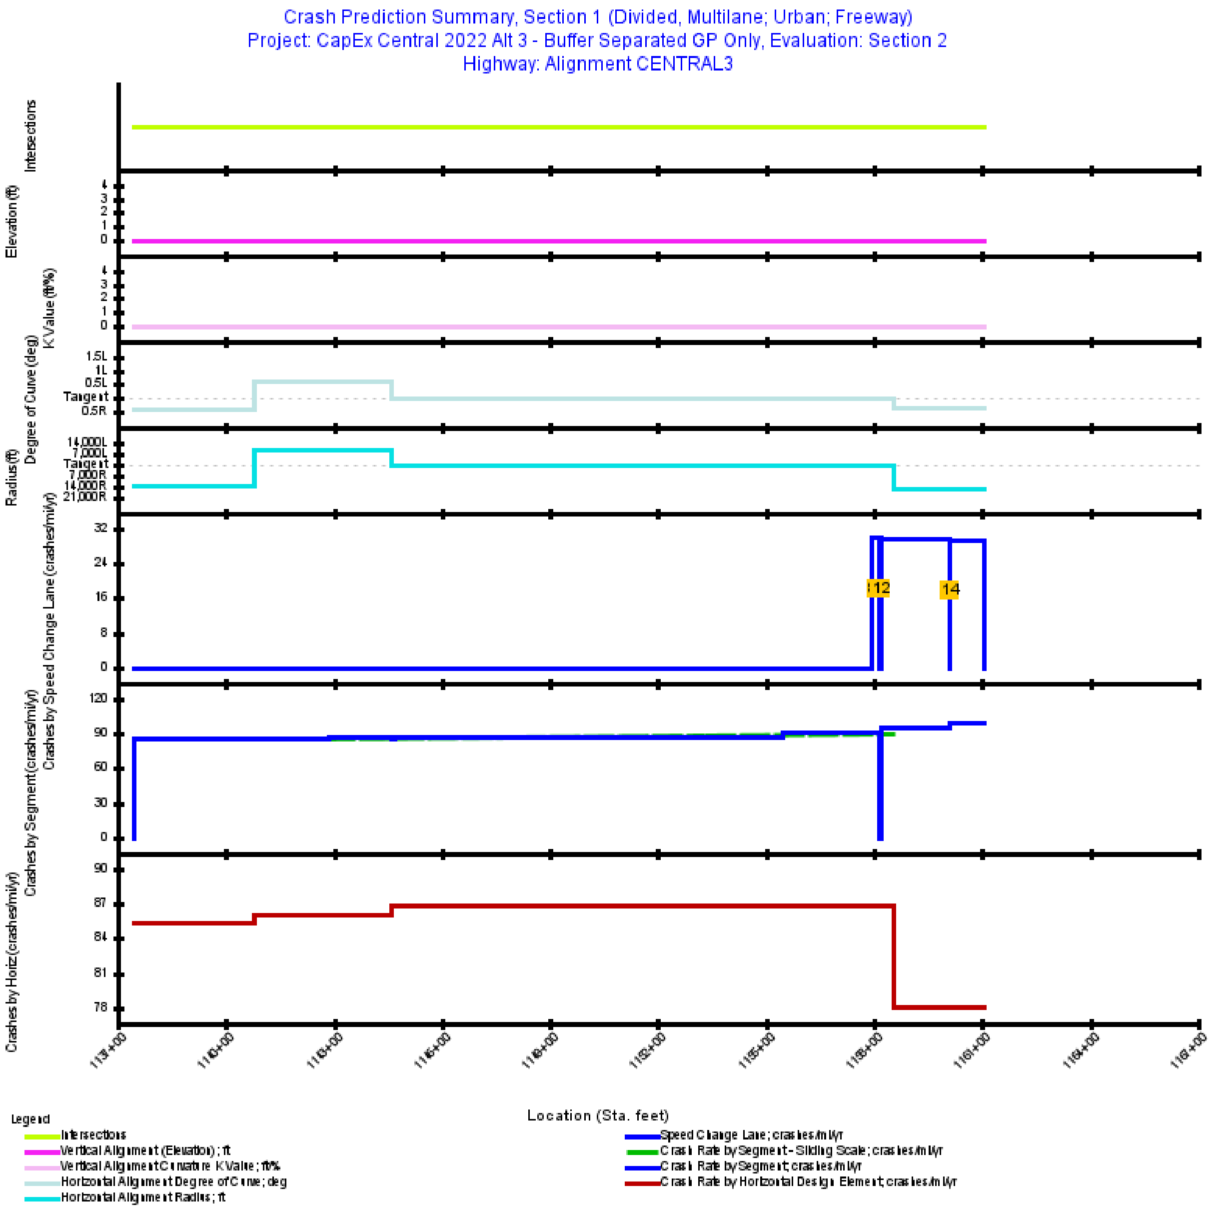
The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1137+45.515
Evaluation End Location: 1161+05.035
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;



Crash Prediction Summary, Section 1 (Divided, Multilane; Urban; Freeway)

14	Ten-lane Freeway Speed Change	Exit	1160+10.515	1161+05.035	94.52	0.0179	2030: 231,000	66.00	Non-Traversable Median	73.50

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.4170**
Average Future Road AADT (vpd)	**231,000**
Predicted Crashes	
Total Crashes	**36.47**
Fatal and Injury Crashes	**9.92**
Property-Damage-Only Crashes	**26.55**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**27**
Percent Property-Damage-Only Crashes (%)	**73**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**87.4466**
FI Crash Rate (crashes/mi/yr)	**23.7844**
PDO Crash Rate (crashes/mi/yr)	**63.6622**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**35.16**
Travel Crash Rate (crashes/million veh-mi)	**1.04**
Travel FI Crash Rate (crashes/million veh-mi)	**0.28**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.76**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0591**
Average Future Road AADT (vpd)	**115,500**
Predicted Crashes	
Total Crashes	**1.75**
Fatal and Injury Crashes	**0.52**
Property-Damage-Only Crashes	**1.23**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**29.6532**
FI Crash Rate (crashes/mi/yr)	**8.8311**
PDO Crash Rate (crashes/mi/yr)	**20.8221**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**2.49**
Travel Crash Rate (crashes/million veh-mi)	**0.70**
Travel FI Crash Rate (crashes/million veh-mi)	**0.21**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.49**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1137+45.515	1137+45.520	0.0000	0.000	0.0000	0.0000	0.0000	0.0000	0.00
2	1137+45.520	1139+25.515	0.0341	2.902	2.9019	0.7872	2.1147	85.1246	1.01
3	1139+25.515	1142+84.515	0.0680	5.822	5.8222	1.5790	4.2432	85.6298	1.02
4	1142+84.515	1144+57.600	0.0328	2.836	2.8356	0.7692	2.0664	86.4999	1.03
5	1144+57.600	1144+70.530	0.0024	0.209	0.2093	0.0569	0.1524	85.4826	1.01
6	1144+70.530	1155+46.100	0.2037	17.625	17.6251	4.7978	12.8274	86.5223	1.03
7	1155+46.100	1158+16.170	0.0490	4.459	4.4593	1.2169	3.2425	91.0524	1.08
9	1158+16.170	1158+19.515	0.0000	0.000	0.0000	0.0000	0.0000	0.0000	0.00
11	1158+19.515	1160+10.515	0.0181	1.726	1.7265	0.4704	1.2560	95.4520	1.13
13	1160+10.515	1161+05.035	0.0090	0.888	0.8881	0.2415	0.6466	99.2238	1.18
Total			0.4170	36.468	36.4680	9.9188	26.5492	87.4466	1.04

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 6. Predicted Crash Frequencies and Rates by Freeway Speed Change Lane (Speed Change)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
8	1157+93.210	1158+16.170	0.0043	0.130	0.1300	0.0388	0.0912	29.8932	0.71
10	1158+16.170	1158+19.515	0.0006	0.019	0.0189	0.0057	0.0133	29.8793	0.71
12	1158+19.515	1160+10.515	0.0362	1.076	1.0758	0.3205	0.7554	29.7407	0.70
14	1160+10.515	1161+05.035	0.0179	0.526	0.5265	0.1566	0.3699	29.4101	0.70
Total			0.0591	1.751	1.7513	0.5215	1.2297	29.6532	0.70

Note: *Travel Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 7. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
Simple Curve 1	1137+45.515	1140+78.292	0.0630	5.380	5.3796	1.4591	3.9205	85.3553	1.01

Total	0.0119	0.0250	0.1738	0.3108	1.2297

Table 11. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.01	0.0	0.20	0.5	0.21	0.6
Highway Segment	Collision with Fixed Object	2.45	6.7	6.38	17.5	8.83	24.2
Highway Segment	Collision with Other Object	0.17	0.5	1.24	3.4	1.41	3.9
Highway Segment	Other Single-vehicle Collision	0.70	1.9	0.95	2.6	1.66	4.5
Highway Segment	Collision with Parked Vehicle	0.05	0.1	0.14	0.4	0.19	0.5
Highway Segment	Total Single Vehicle Crashes	3.39	9.3	8.91	24.4	12.31	33.7
Highway Segment	Right-Angle Collision	0.20	0.6	0.32	0.9	0.52	1.4
Highway Segment	Head-on Collision	0.05	0.1	0.04	0.1	0.09	0.2
Highway Segment	Other Multi-vehicle Collision	0.20	0.6	0.42	1.2	0.63	1.7
Highway Segment	Rear-end Collision	4.90	13.4	12.17	33.4	17.06	46.8
Highway Segment	Sideswipe, Same Direction Collision	1.18	3.2	4.69	12.9	5.87	16.1
Highway Segment	Total Multiple Vehicle Crashes	6.53	17.9	17.63	48.4	24.16	66.3
Highway Segment	Total Highway Segment Crashes	9.92	27.2	26.55	72.8	36.47	100.0
	Total Crashes	9.92	27.2	26.55	72.8	36.47	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 12. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.01	0.5	0.01	0.5
Highway Segment	Collision with Fixed Object	0.10	5.8	0.26	14.5	0.36	20.4
Highway Segment	Collision with Other Object	0.01	0.5	0.04	2.1	0.04	2.6
Highway Segment	Other Single-vehicle Collision	0.03	1.5	0.03	1.6	0.05	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.14	7.8	0.33	18.7	0.46	26.5
Highway Segment	Right-Angle Collision	0.01	0.3	0.01	0.8	0.02	1.2
Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.01	0.3
Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.02	1.1	0.03	1.6
Highway Segment	Rear-end Collision	0.29	16.4	0.69	39.7	0.98	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.08	4.7	0.17	9.7	0.25	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.39	22.0	0.90	51.5	1.29	73.5
Highway Segment	Total Highway Segment Crashes	0.52	29.8	1.23	70.2	1.75	100.0
	Total Crashes	0.52	29.8	1.23	70.2	1.75	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1137+45.515	1137+45.520	Information: for segment #1 (1137+45.515 to 1137+45.520), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.515	1137+45.520	Information: for segment #1 (1137+45.515 to 1137+45.520), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.515	1137+45.520	Information: for segment #1 (1137+45.515 to 1137+45.520), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.515	1137+45.520	Information: for segment #1 (1137+45.515 to 1137+45.520), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.520	1139+25.515	Information: for segment #2 (1137+45.520 to 1139+25.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.520	1139+25.515	Information: for segment #2 (1137+45.520 to 1139+25.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.520	1139+25.515	Information: for segment #2 (1137+45.520 to 1139+25.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1137+45.520	1139+25.515	Information: for segment #2 (1137+45.520 to 1139+25.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+25.515	1142+84.515	Information: for segment #3 (1139+25.515 to 1142+84.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+25.515	1142+84.515	Information: for segment #3 (1139+25.515 to 1142+84.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+25.515	1142+84.515	Information: for segment #3 (1139+25.515 to 1142+84.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1139+25.515	1142+84.515	Information: for segment #3 (1139+25.515 to 1142+84.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+84.515	1144+57.600	Information: for segment #4 (1142+84.515 to 1144+57.600), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+84.515	1144+57.600	Information: for segment #4 (1142+84.515 to 1144+57.600), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+84.515	1144+57.600	Information: for segment #4 (1142+84.515 to 1144+57.600), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1142+84.515	1144+57.600	Information: for segment #4 (1142+84.515 to 1144+57.600), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+57.600	1144+70.530	Information: for segment #5 (1144+57.600 to 1144+70.530), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+57.600	1144+70.530	Information: for segment #5 (1144+57.600 to 1144+70.530), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+57.600	1144+70.530	Information: for segment #5 (1144+57.600 to 1144+70.530), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+57.600	1144+70.530	Information: for segment #5 (1144+57.600 to 1144+70.530), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+70.530	1155+46.100	Information: for segment #6 (1144+70.530 to 1155+46.100), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+70.530	1155+46.100	Information: for segment #6 (1144+70.530 to 1155+46.100), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1144+70.530	1155+46.100	Information: for segment #6 (1144+70.530 to 1155+46.100), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1144+70.530	1155+46.100	Information: for segment #6 (1144+70.530 to 1155+46.100), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1155+46.100	1158+16.170	Information: for segment #7 (1155+46.100 to 1158+16.170), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1155+46.100	1158+16.170	Information: for segment #7 (1155+46.100 to 1158+16.170), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1155+46.100	1158+16.170	Information: for segment #7 (1155+46.100 to 1158+16.170), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1155+46.100	1158+16.170	Information: for segment #7 (1155+46.100 to 1158+16.170), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+16.170	1158+19.515	Information: for segment #9 (1158+16.170 to 1158+19.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+16.170	1158+19.515	Information: for segment #9 (1158+16.170 to 1158+19.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+16.170	1158+19.515	Information: for segment #9 (1158+16.170 to 1158+19.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+16.170	1158+19.515	Information: for segment #9 (1158+16.170 to 1158+19.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+19.515	1160+10.515	Information: for segment #11 (1158+19.515 to 1160+10.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+19.515	1160+10.515	Information: for segment #11 (1158+19.515 to 1160+10.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+19.515	1160+10.515	Information: for segment #11 (1158+19.515 to 1160+10.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+19.515	1160+10.515	Information: for segment #11 (1158+19.515 to 1160+10.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+10.515	1161+05.035	Information: for segment #13 (1160+10.515 to 1161+05.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+10.515	1161+05.035	Information: for segment #13 (1160+10.515 to 1161+05.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+10.515	1161+05.035	Information: for segment #13 (1160+10.515 to 1161+05.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+10.515	1161+05.035	Information: for segment #13 (1160+10.515 to 1161+05.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1157+93.210	1158+16.170	Information: for segment #8 (1157+93.210 to 1158+16.170), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+16.170	1158+19.515	Information: for segment #10 (1158+16.170 to 1158+19.515), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1158+19.515	1160+10.515	Information: for segment #12 (1158+19.515 to 1160+10.515), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1160+10.515	1161+05.035	Information: for segment #14 (1160+10.515 to 1161+05.035), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 3
Evaluation Comment: Created Thu Jun 23 12:22:56 CDT 2022

Minimum Location: 1188+09.855
Maximum Location: 1317+43.705

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1188+09.855
Evaluation End Location: 1317+43.705
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

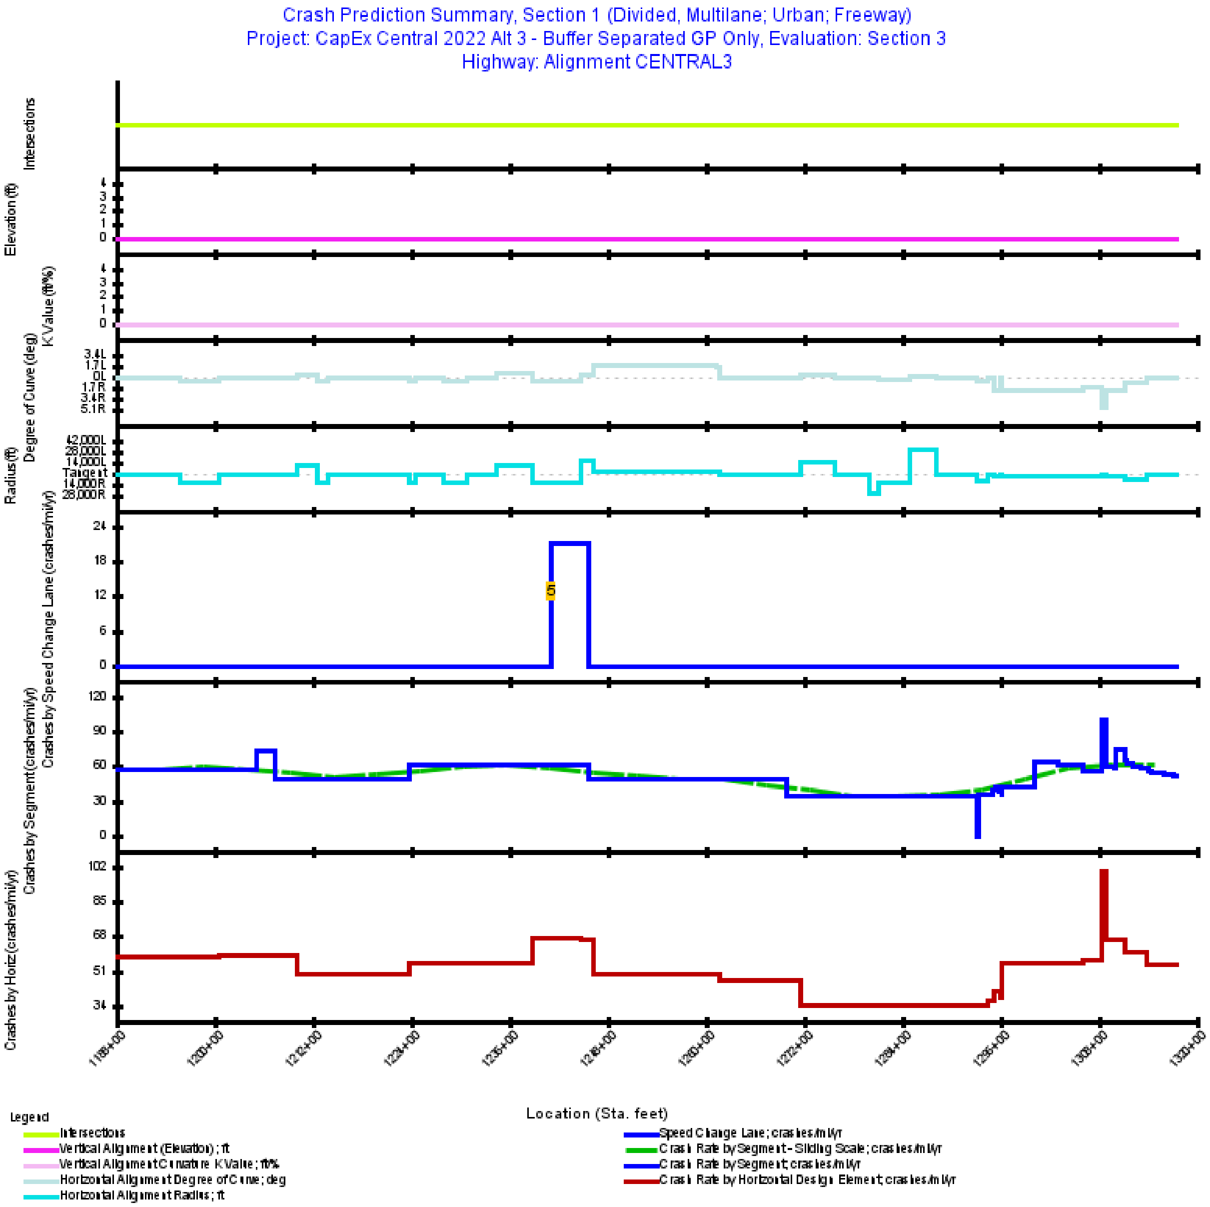

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Eight-lane Freeway	Urban	1188+09.855	1205+10.860	1,701.01	0.3222	2030: 158,500	64.00	Non-Traversable Median	72.00

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
5	Eight-lane Freeway Speed Change	Exit	1241+11.480	1245+66.480	455.00	0.0862	2030: 163,000	64.00	Non-Traversable Median	71.61

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**2.4056**
Average Future Road AADT (vpd)	**137,358**
Predicted Crashes	
Total Crashes	**123.48**
Fatal and Injury Crashes	**34.63**
Property-Damage-Only Crashes	**88.84**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**51.3293**
FI Crash Rate (crashes/mi/yr)	**14.3968**
PDO Crash Rate (crashes/mi/yr)	**36.9325**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**120.60**
Travel Crash Rate (crashes/million veh-mi)	**1.02**
Travel FI Crash Rate (crashes/million veh-mi)	**0.29**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.74**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0862**
Average Future Road AADT (vpd)	**81,500**
Predicted Crashes	
Total Crashes	**1.82**
Fatal and Injury Crashes	**0.53**
Property-Damage-Only Crashes	**1.28**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**21.0823**
FI Crash Rate (crashes/mi/yr)	**6.1730**
PDO Crash Rate (crashes/mi/yr)	**14.9093**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**2.56**
Travel Crash Rate (crashes/million veh-mi)	**0.71**
Travel FI Crash Rate (crashes/million veh-mi)	**0.21**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.50**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1188+09.855	1205+10.860	0.3222	18.652	18.6521	5.1644	13.4878	57.8971	1.00

Highway Segment	Sideswipe, Same Direction Collision	3.86	3.1	14.16	11.5	18.02	14.6
Highway Segment	Total Multiple Vehicle Crashes	21.45	17.4	53.24	43.1	74.69	60.5
Highway Segment	Total Highway Segment Crashes	34.63	28.0	88.84	72.0	123.48	100.0
	Total Crashes	34.63	28.0	88.84	72.0	123.48	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 12. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.01	0.5	0.01	0.5
Highway Segment	Collision with Fixed Object	0.10	5.7	0.27	14.6	0.37	20.4
Highway Segment	Collision with Other Object	0.01	0.5	0.04	2.1	0.05	2.6
Highway Segment	Other Single-vehicle Collision	0.03	1.4	0.03	1.6	0.06	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.14	7.6	0.34	18.9	0.48	26.5
Highway Segment	Right-Angle Collision	0.01	0.3	0.01	0.8	0.02	1.2
Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.01	0.3
Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.02	1.1	0.03	1.6
Highway Segment	Rear-end Collision	0.29	16.1	0.73	40.0	1.02	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.08	4.6	0.18	9.8	0.26	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.39	21.6	0.94	51.8	1.33	73.5
Highway Segment	Total Highway Segment Crashes	0.53	29.3	1.28	70.7	1.82	100.0
	Total Crashes	0.53	29.3	1.28	70.7	1.82	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1245+66.480	1269+73.040	Information: for segment #6 (1245+66.480 to 1269+73.040), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1245+66.480	1269+73.040	Information: for segment #6 (1245+66.480 to 1269+73.040), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1245+66.480	1269+73.040	Information: for segment #6 (1245+66.480 to 1269+73.040), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1245+66.480	1269+73.040	Information: for segment #6 (1245+66.480 to 1269+73.040), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1269+73.040	1272+14.855	Information: for segment #7 (1269+73.040 to 1272+14.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1269+73.040	1272+14.855	Information: for segment #7 (1269+73.040 to 1272+14.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1241+11.480	1245+66.480	Information: for segment #5 (1241+11.480 to 1245+66.480), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Warning: for segment #1 (1188+09.855 to 1205+10.860), Freeway Segment of type 8F is using unbalanced lane processing with 3 + 5 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1245+66.480	1269+73.040	Information: for segment #6 (1245+66.480 to 1269+73.040), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1300+07.160	1302+89.855	Information: for segment #18 (1300+07.160 to 1302+89.855), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1302+89.855	1305+90.560	Information: for segment #19 (1302+89.855 to 1305+90.560), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1305+90.560	1306+64.855	Information: for segment #20 (1305+90.560 to 1306+64.855), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1306+64.855	1307+03.855	Information: for segment #21 (1306+64.855 to 1307+03.855), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1307+03.855	1308+11.855	Information: for segment #22 (1307+03.855 to 1308+11.855), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1308+11.855	1308+33.900	Information: for segment #23 (1308+11.855 to 1308+33.900), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1308+33.900	1308+85.530	Information: for segment #24 (1308+33.900 to 1308+85.530), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1308+85.530	1309+25.855	Information: for segment #25 (1308+85.530 to 1309+25.855), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1309+25.855	1309+87.855	Information: for segment #26 (1309+25.855 to 1309+87.855), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1309+87.855	1310+05.140	Information: for segment #27 (1309+87.855 to 1310+05.140), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 4
Evaluation Comment: Created Thu Jun 23 12:25:39 CDT 2022

Minimum Location: 1340+47.770
Maximum Location: 1418+65.083

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1340+47.770
Evaluation End Location: 1418+65.083
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EN=1.0; FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EN=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

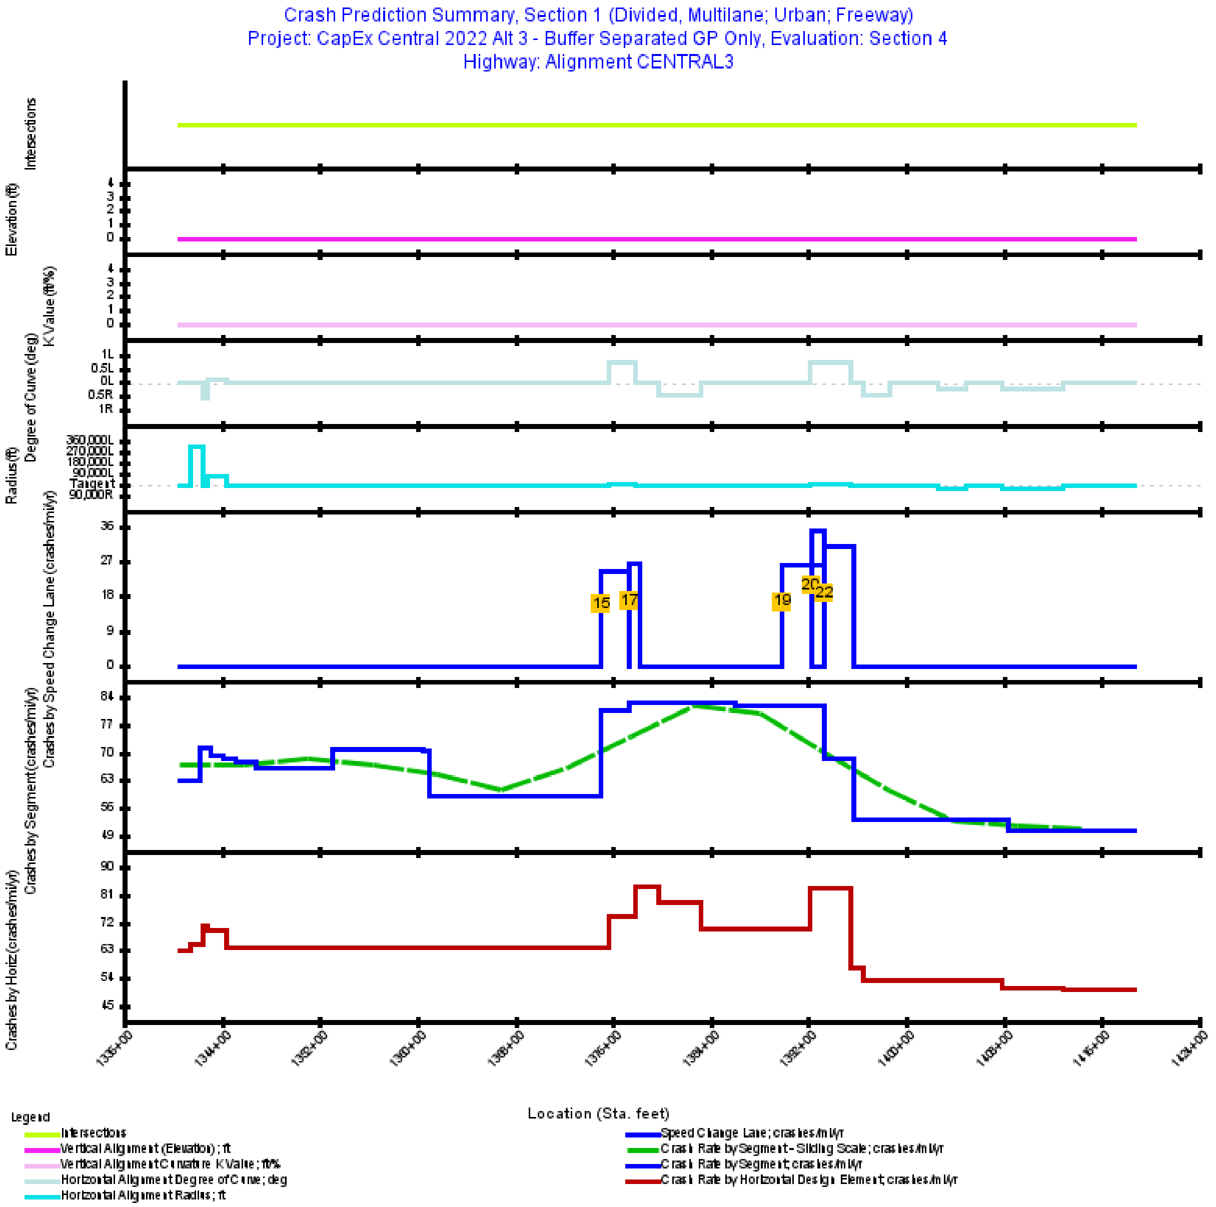

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Nine-lane Freeway	Urban	1340+47.770	1340+99.770	52.00	0.0098	2030: 183,600	58.00	Non-Traversable Median	77.49
2	Nine-lane Freeway	Urban	1340+99.770	1342+01.770	102.00	0.0193	2030: 183,600	58.00	Non-Traversable Median	75.99
3	Nine-lane Freeway	Urban	1342+01.770	1342+19.830	18.06	0.0034	2030: 183,600	58.00	Non-Traversable Median	74.81
4	Ten-lane Freeway	Urban	1342+19.830	1343+03.770	83.94	0.0159	2030: 190,950	58.00	Non-Traversable Median	73.81
5	Ten-lane Freeway	Urban	1343+03.770	1344+05.770	102.00	0.0193	2030: 190,950	58.00	Non-Traversable Median	71.99
6	Ten-lane Freeway	Urban	1344+05.770	1345+08.770	103.00	0.0195	2030: 190,950	58.00	Non-Traversable Median	69.99

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.3840**
Average Future Road AADT (vpd)	**173,767**
Predicted Crashes	
Total Crashes	**88.76**
Fatal and Injury Crashes	**24.91**
Property-Damage-Only Crashes	**63.85**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**64.1367**
FI Crash Rate (crashes/mi/yr)	**17.9972**
PDO Crash Rate (crashes/mi/yr)	**46.1396**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**87.78**
Travel Crash Rate (crashes/million veh-mi)	**1.01**
Travel FI Crash Rate (crashes/million veh-mi)	**0.28**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.73**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.1932**
Average Future Road AADT (vpd)	**95,699**
Predicted Crashes	
Total Crashes	**5.39**
Fatal and Injury Crashes	**1.77**
Property-Damage-Only Crashes	**3.62**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**33**
Percent Property-Damage-Only Crashes (%)	**67**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**27.8827**
FI Crash Rate (crashes/mi/yr)	**9.1516**
PDO Crash Rate (crashes/mi/yr)	**18.7311**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**6.75**
Travel Crash Rate (crashes/million veh-mi)	**0.80**
Travel FI Crash Rate (crashes/million veh-mi)	**0.26**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.54**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1340+47.770	1340+99.770	0.0098	0.620	0.6198	0.1728	0.4470	62.9295	0.94

Total	0.0396	0.0828	0.5839	1.0616	3.6185

Table 11. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.03	0.0	0.50	0.6	0.54	0.6
Highway Segment	Collision with Fixed Object	6.21	7.0	16.42	18.5	22.62	25.5
Highway Segment	Collision with Other Object	0.44	0.5	3.19	3.6	3.62	4.1
Highway Segment	Other Single-vehicle Collision	1.79	2.0	2.45	2.8	4.24	4.8
Highway Segment	Collision with Parked Vehicle	0.13	0.1	0.37	0.4	0.50	0.6
Highway Segment	Total Single Vehicle Crashes	8.60	9.7	22.93	25.8	31.52	35.5
Highway Segment	Right-Angle Collision	0.51	0.6	0.74	0.8	1.24	1.4
Highway Segment	Head-on Collision	0.13	0.1	0.08	0.1	0.21	0.2
Highway Segment	Other Multi-vehicle Collision	0.51	0.6	0.98	1.1	1.49	1.7
Highway Segment	Rear-end Collision	12.23	13.8	28.24	31.8	40.47	45.6
Highway Segment	Sideswipe, Same Direction Collision	2.94	3.3	10.89	12.3	13.82	15.6
Highway Segment	Total Multiple Vehicle Crashes	16.31	18.4	40.93	46.1	57.24	64.5
Highway Segment	Total Highway Segment Crashes	24.91	28.1	63.85	71.9	88.76	100.0
	Total Crashes	24.91	28.1	63.85	71.9	88.76	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 12. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.02	0.5	0.02	0.5
Highway Segment	Collision with Fixed Object	0.19	5.9	0.47	14.5	0.66	20.4
Highway Segment	Collision with Other Object	0.02	0.5	0.07	2.1	0.08	2.6
Highway Segment	Other Single-vehicle Collision	0.05	1.5	0.05	1.6	0.10	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.25	7.9	0.60	18.6	0.86	26.5
Highway Segment	Right-Angle Collision	0.01	0.3	0.03	0.8	0.04	1.2
Highway Segment	Head-on Collision	0.01	0.2	0.01	0.1	0.01	0.3
Highway Segment	Other Multi-vehicle Collision	0.02	0.5	0.04	1.1	0.05	1.6
Highway Segment	Rear-end Collision	0.54	16.6	1.27	39.4	1.81	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.15	4.8	0.31	9.6	0.47	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.72	22.3	1.65	51.2	2.37	73.5
Highway Segment	Total Highway Segment Crashes	0.97	30.2	2.25	69.8	3.23	100.0
	Total Crashes	0.97	30.2	2.25	69.8	3.23	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Predicted Entrance Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.00	0.1	0.00	0.1
Highway Segment	Collision with Fixed Object	0.15	7.1	0.18	8.2	0.33	15.3
Highway Segment	Collision with Other Object	0.01	0.7	0.05	2.3	0.06	3.0
Highway Segment	Other Single-vehicle Collision	0.05	2.5	0.02	1.0	0.07	3.5
Highway Segment	Collision with Parked Vehicle	0.00	0.1	0.00	0.2	0.01	0.3
Highway Segment	Total Single Vehicle Crashes	0.23	10.4	0.25	11.8	0.48	22.2
Highway Segment	Right-Angle Collision	0.01	0.7	0.02	1.0	0.04	1.7
Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.01	0.2
Highway Segment	Other Multi-vehicle Collision	0.01	0.6	0.02	0.9	0.03	1.6
Highway Segment	Rear-end Collision	0.43	20.0	0.72	33.5	1.16	53.5
Highway Segment	Sideswipe, Same Direction Collision	0.11	4.9	0.34	15.9	0.45	20.8
Highway Segment	Total Multiple Vehicle Crashes	0.57	26.3	1.11	51.5	1.68	77.8
Highway Segment	Total Highway Segment Crashes	0.79	36.8	1.36	63.2	2.16	100.0
	Total Crashes	0.79	36.8	1.36	63.2	2.16	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 14. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1340+47.770	1340+99.770	Information: for segment #1 (1340+47.770 to 1340+99.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+47.770	1340+99.770	Information: for segment #1 (1340+47.770 to 1340+99.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+47.770	1340+99.770	Information: for segment #1 (1340+47.770 to 1340+99.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+47.770	1340+99.770	Information: for segment #1 (1340+47.770 to 1340+99.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+99.770	1342+01.770	Information: for segment #2 (1340+99.770 to 1342+01.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+99.770	1342+01.770	Information: for segment #2 (1340+99.770 to 1342+01.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+99.770	1342+01.770	Information: for segment #2 (1340+99.770 to 1342+01.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+99.770	1342+01.770	Information: for segment #2 (1340+99.770 to 1342+01.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+01.770	1342+19.830	Information: for segment #3 (1342+01.770 to 1342+19.830), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+01.770	1342+19.830	Information: for segment #3 (1342+01.770 to 1342+19.830), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+01.770	1342+19.830	Information: for segment #3 (1342+01.770 to 1342+19.830), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+01.770	1342+19.830	Information: for segment #3 (1342+01.770 to 1342+19.830), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+03.770	Information: for segment #4 (1342+19.830 to 1343+03.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+03.770	Information: for segment #4 (1342+19.830 to 1343+03.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+03.770	Information: for segment #4 (1342+19.830 to 1343+03.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+03.770	Information: for segment #4 (1342+19.830 to 1343+03.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+03.770	1344+05.770	Information: for segment #5 (1343+03.770 to 1344+05.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+03.770	1344+05.770	Information: for segment #5 (1343+03.770 to 1344+05.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+03.770	1344+05.770	Information: for segment #5 (1343+03.770 to 1344+05.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+03.770	1344+05.770	Information: for segment #5 (1343+03.770 to 1344+05.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+05.770	1345+08.770	Information: for segment #6 (1344+05.770 to 1345+08.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+05.770	1345+08.770	Information: for segment #6 (1344+05.770 to 1345+08.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1344+05.770	1345+08.770	Information: for segment #6 (1344+05.770 to 1345+08.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1344+05.770	1345+08.770	Information: for segment #6 (1344+05.770 to 1345+08.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1345+08.770	1346+10.770	Information: for segment #7 (1345+08.770 to 1346+10.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1392+22.290	1393+31.380	Information: for segment #20 (1392+22.290 to 1393+31.380), Speed Change Segment of type Nine-lane Freeway Speed Change is using unbalanced lane processing with types Eight-lane Freeway Speed Change and Ten-lane Freeway Speed Change

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Maximum Location: 1055+87.420

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1055+87.420
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_MV=1.0; FI_SV=1.0; PDO_MV=1.0; PDO_SV=1.0;

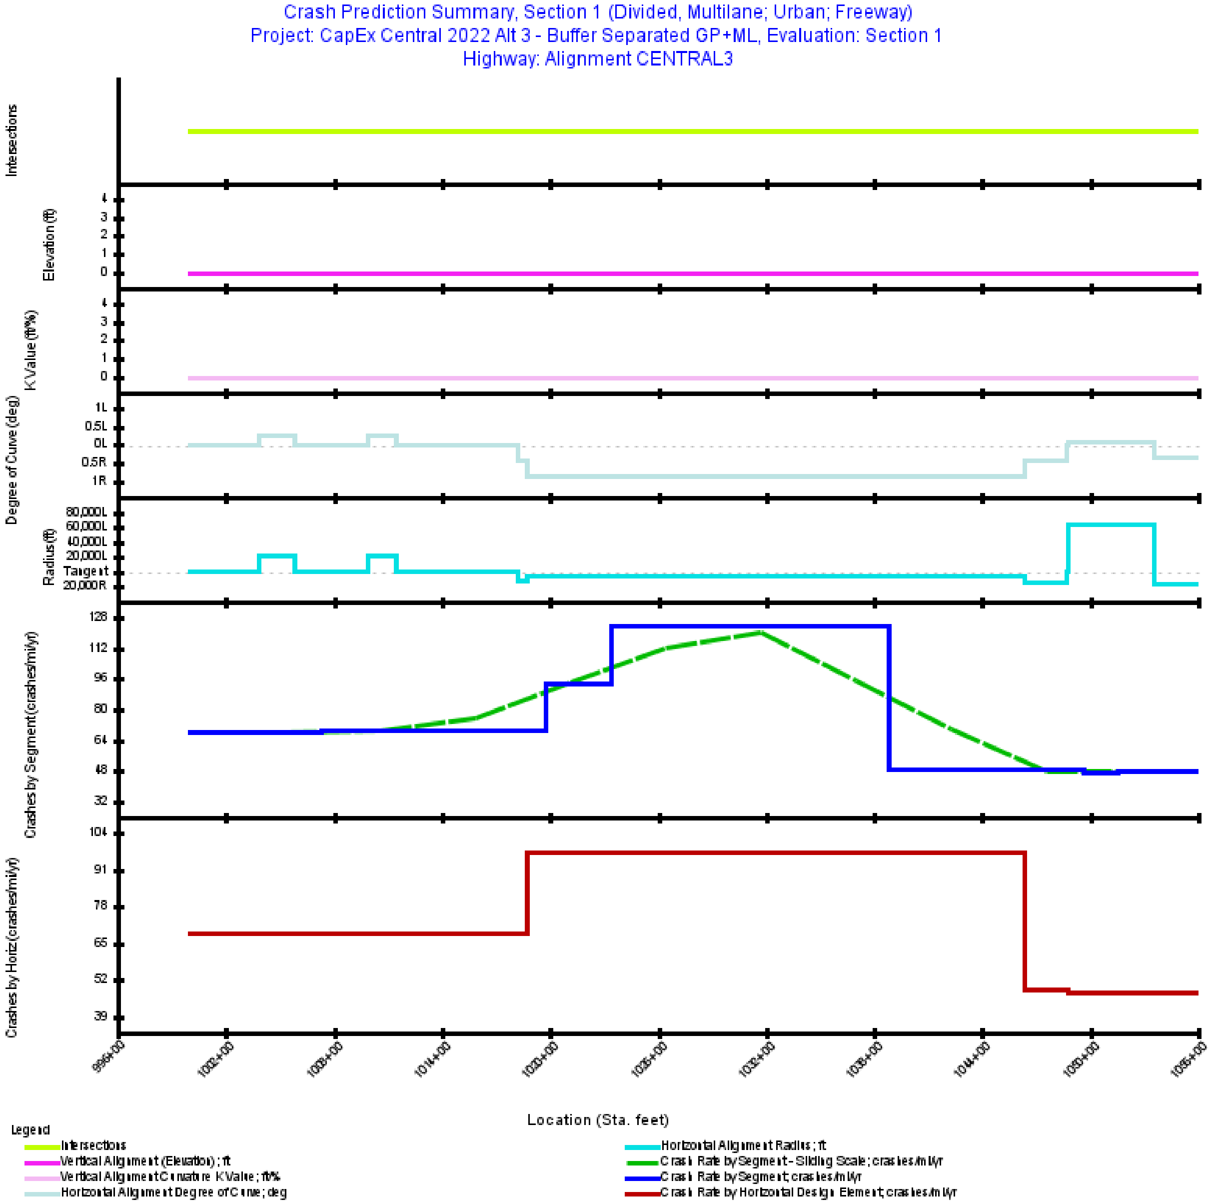

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1000+00.000	1007+26.000	726.00	0.1375	2030: 203,650	20.00	Non-Traversable Median	25.50
2	Ten-lane Freeway	Urban	1007+26.000	1019+79.090	1,253.09	0.2373	2030: 203,650	8.13	Non-Traversable Median	18.56

Table 2. User Defined CMF Used in the Eval Segment CPM Evaluation (Section 1)

Name	Description	Start Loc. (Sta. ft)	End Loc. (Sta. ft)	Start CMF Year	End CMF Year	Severity	CMF Value
11	remove 20 left	1019+79.090	1023+40.350	2030	2050	Total	1.1000
12	remove 20 both	1023+40.350	1038+82.050	2030	2050	Total	1.2000
11	remove 20 left	1038+82.050	1038+82.880	2030	2050	Total	1.1000

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.0582**
Average Future Road AADT (vpd)	**198,659**
Predicted Crashes	
Total Crashes	**83.80**
Fatal and Injury Crashes	**23.36**
Property-Damage-Only Crashes	**60.44**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**28**
Percent Property-Damage-Only Crashes (%)	**72**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**79.1892**
FI Crash Rate (crashes/mi/yr)	**22.0740**
PDO Crash Rate (crashes/mi/yr)	**57.1152**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**76.73**
Travel Crash Rate (crashes/million veh-mi)	**1.09**
Travel FI Crash Rate (crashes/million veh-mi)	**0.30**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.79**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.
Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 4. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1000+00.000	1007+26.000	0.1375	9.414	9.4142	2.6351	6.7790	68.4668	0.92
2	1007+26.000	1019+79.090	0.2373	16.299	16.2985	4.5617	11.7368	68.6752	0.92
3	1019+79.090	1023+40.350	0.0684	6.398	6.3983	1.7626	4.6358	93.5147	1.18
4	1023+40.350	1038+82.880	0.2921	36.139	36.1391	9.7575	26.3816	123.7022	1.45
5	1038+82.880	1049+61.000	0.2042	9.915	9.9147	2.9584	6.9563	48.5566	0.85
6	1049+61.000	1051+50.000	0.0358	1.697	1.6972	0.5073	1.1899	47.4134	0.83
7	1051+50.000	1055+48.000	0.0754	3.582	3.5821	1.0704	2.5117	47.5216	0.83
8	1055+48.000	1055+87.420	0.0075	0.356	0.3557	0.1063	0.2494	47.6438	0.83
Total			1.0582	83.800	83.7999	23.3593	60.4406	79.1892	1.09

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 5. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Total	0.5310	1.1125	7.7638	13.9520	60.4406

Table 8. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.03	0.0	0.48	0.6	0.52	0.6
Highway Segment	Collision with Fixed Object	6.18	7.4	15.64	18.7	21.82	26.0
Highway Segment	Collision with Other Object	0.44	0.5	3.04	3.6	3.47	4.1
Highway Segment	Other Single-vehicle Collision	1.78	2.1	2.34	2.8	4.12	4.9
Highway Segment	Collision with Parked Vehicle	0.13	0.2	0.35	0.4	0.48	0.6
Highway Segment	Total Single Vehicle Crashes	8.56	10.2	21.85	26.1	30.40	36.3
Highway Segment	Right-Angle Collision	0.46	0.5	0.69	0.8	1.15	1.4
Highway Segment	Head-on Collision	0.12	0.1	0.08	0.1	0.20	0.2
Highway Segment	Other Multi-vehicle Collision	0.46	0.5	0.93	1.1	1.39	1.7
Highway Segment	Rear-end Collision	11.10	13.2	26.63	31.8	37.73	45.0
Highway Segment	Sideswipe, Same Direction Collision	2.67	3.2	10.27	12.2	12.93	15.4
Highway Segment	Total Multiple Vehicle Crashes	14.80	17.7	38.59	46.1	53.40	63.7
Highway Segment	Total Highway Segment Crashes	23.36	27.9	60.44	72.1	83.80	100.0
	Total Crashes	23.36	27.9	60.44	72.1	83.80	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 9. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1000+00.000	1007+26.000	Information: for segment #1 (1000+00.000 to 1007+26.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1007+26.000	Information: for segment #1 (1000+00.000 to 1007+26.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1007+26.000	Information: for segment #1 (1000+00.000 to 1007+26.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1000+00.000	1007+26.000	Information: for segment #1 (1000+00.000 to 1007+26.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1007+26.000	1019+79.090	Information: for segment #2 (1007+26.000 to 1019+79.090), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1007+26.000	1019+79.090	Information: for segment #2 (1007+26.000 to 1019+79.090), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1007+26.000	1019+79.090	Information: for segment #2 (1007+26.000 to 1019+79.090), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1007+26.000	1019+79.090	Information: for segment #2 (1007+26.000 to 1019+79.090), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+79.090	1023+40.350	Information: for segment #3 (1019+79.090 to 1023+40.350), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+79.090	1023+40.350	Information: for segment #3 (1019+79.090 to 1023+40.350), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+79.090	1023+40.350	Information: for segment #3 (1019+79.090 to 1023+40.350), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1019+79.090	1023+40.350	Information: for segment #3 (1019+79.090 to 1023+40.350), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+40.350	1038+82.880	Information: for segment #4 (1023+40.350 to 1038+82.880), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+40.350	1038+82.880	Information: for segment #4 (1023+40.350 to 1038+82.880), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+40.350	1038+82.880	Information: for segment #4 (1023+40.350 to 1038+82.880), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1023+40.350	1038+82.880	Information: for segment #4 (1023+40.350 to 1038+82.880), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+82.880	1049+61.000	Information: for segment #5 (1038+82.880 to 1049+61.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+82.880	1049+61.000	Information: for segment #5 (1038+82.880 to 1049+61.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+82.880	1049+61.000	Information: for segment #5 (1038+82.880 to 1049+61.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1038+82.880	1049+61.000	Information: for segment #5 (1038+82.880 to 1049+61.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1049+61.000	1051+50.000	Information: for segment #6 (1049+61.000 to 1051+50.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1049+61.000	1051+50.000	Information: for segment #6 (1049+61.000 to 1051+50.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1049+61.000	1051+50.000	Information: for segment #6 (1049+61.000 to 1051+50.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1049+61.000	1051+50.000	Information: for segment #6 (1049+61.000 to 1051+50.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1051+50.000	1055+48.000	Information: for segment #7 (1051+50.000 to 1055+48.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1051+50.000	1055+48.000	Information: for segment #7 (1051+50.000 to 1055+48.000), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1051+50.000	1055+48.000	Information: for segment #7 (1051+50.000 to 1055+48.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1051+50.000	1055+48.000	Information: for segment #7 (1051+50.000 to 1055+48.000), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1055+48.000	1055+87.420	Information: for segment #8 (1055+48.000 to 1055+87.420), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1055+48.000	1055+87.420	Information: for segment #8 (1055+48.000 to 1055+87.420), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1055+48.000	1055+87.420	Information: for segment #8 (1055+48.000 to 1055+87.420), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1055+48.000	1055+87.420	Information: for segment #8 (1055+48.000 to 1055+87.420), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1137+45.515	1161+05.035	2,359.52	0.4469	2030: 231,000	14.00	Non-Traversable Median	18.00

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
2	Ten-lane Freeway Speed Change	Exit	1157+93.210	1161+05.035	311.82	0.0591	2030: 231,000	13.23	Non-Traversable Median	21.00

Table 3. User Defined CMF Used in the Eval Segment CPM Evaluation (Section 1)

Name	Description	Start Loc. (Sta. ft)	End Loc. (Sta. ft)	Start CMF Year	End CMF Year	Severity	CMF Value
14	remove 10 both, remove 20 both	1137+45.515	1161+05.035	2030	2050	Total	1.4000

Table 4. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.4173**
Average Future Road AADT (vpd)	**231,000**
Predicted Crashes	
Total Crashes	**50.24**
Fatal and Injury Crashes	**13.64**
Property-Damage-Only Crashes	**36.60**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**27**
Percent Property-Damage-Only Crashes (%)	**73**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**120.3701**
FI Crash Rate (crashes/mi/yr)	**32.6760**
PDO Crash Rate (crashes/mi/yr)	**87.6941**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**35.19**
Travel Crash Rate (crashes/million veh-mi)	**1.43**
Travel FI Crash Rate (crashes/million veh-mi)	**0.39**
Travel PDO Crash Rate (crashes/million veh-mi)	**1.04**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 5. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0591**
Average Future Road AADT (vpd)	**115,500**
Predicted Crashes	
Total Crashes	**2.42**
Fatal and Injury Crashes	**0.72**
Property-Damage-Only Crashes	**1.70**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**40.9800**
FI Crash Rate (crashes/mi/yr)	**12.1910**
PDO Crash Rate (crashes/mi/yr)	**28.7890**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**2.49**
Travel Crash Rate (crashes/million veh-mi)	**0.97**
Travel FI Crash Rate (crashes/million veh-mi)	**0.29**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.68**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 6. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1137+45.515	1161+05.035	0.4173	50.236	50.2365	13.6373	36.5991	120.3701	1.43
Total			0.4173	50.236	50.2365	13.6373	36.5991	120.3701	1.43

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 7. Predicted Crash Frequencies and Rates by Freeway Speed Change Lane (Speed Change)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
2	1157+93.210	1161+05.035	0.0591	2.420	2.4202	0.7200	1.7002	40.9800	0.97
Total			0.0591	2.420	2.4202	0.7200	1.7002	40.9800	0.97

Note: *Travel Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Table 4. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**2.4056**
Average Future Road AADT (vpd)	**137,358**
Predicted Crashes	
Total Crashes	**118.76**
Fatal and Injury Crashes	**36.17**
Property-Damage-Only Crashes	**82.59**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**49.3680**
FI Crash Rate (crashes/mi/yr)	**15.0362**
PDO Crash Rate (crashes/mi/yr)	**34.3318**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**120.60**
Travel Crash Rate (crashes/million veh-mi)	**0.98**
Travel FI Crash Rate (crashes/million veh-mi)	**0.30**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.69**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 5. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0862**
Average Future Road AADT (vpd)	**81,500**
Predicted Crashes	
Total Crashes	**2.18**
Fatal and Injury Crashes	**0.64**
Property-Damage-Only Crashes	**1.54**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**25.2988**
FI Crash Rate (crashes/mi/yr)	**7.4076**
PDO Crash Rate (crashes/mi/yr)	**17.8912**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**2.56**
Travel Crash Rate (crashes/million veh-mi)	**0.85**
Travel FI Crash Rate (crashes/million veh-mi)	**0.25**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.60**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 6. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Table 12. Predicted Freeway Crash Type Distribution (Section 1)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.07	0.1	0.84	0.7	0.90	0.8
Highway Segment	Collision with Fixed Object	11.77	9.9	27.31	23.0	39.07	32.9
Highway Segment	Collision with Other Object	0.83	0.7	5.30	4.5	6.13	5.2
Highway Segment	Other Single-vehicle Collision	3.39	2.9	4.08	3.4	7.47	6.3
Highway Segment	Collision with Parked Vehicle	0.24	0.2	0.61	0.5	0.85	0.7
Highway Segment	Total Single Vehicle Crashes	16.30	13.7	38.14	32.1	54.44	45.8
Highway Segment	Right-Angle Collision	0.62	0.5	0.80	0.7	1.42	1.2
Highway Segment	Head-on Collision	0.16	0.1	0.09	0.1	0.25	0.2
Highway Segment	Other Multi-vehicle Collision	0.62	0.5	1.07	0.9	1.68	1.4
Highway Segment	Rear-end Collision	14.90	12.6	30.67	25.8	45.57	38.4
Highway Segment	Sideswipe, Same Direction Collision	3.58	3.0	11.82	10.0	15.40	13.0
Highway Segment	Total Multiple Vehicle Crashes	19.87	16.7	44.45	37.4	64.32	54.2
Highway Segment	Total Highway Segment Crashes	36.17	30.5	82.59	69.5	118.76	100.0
	Total Crashes	36.17	30.5	82.59	69.5	118.76	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.01	0.5	0.01	0.5
Highway Segment	Collision with Fixed Object	0.12	5.7	0.32	14.6	0.44	20.4
Highway Segment	Collision with Other Object	0.01	0.5	0.05	2.1	0.06	2.6
Highway Segment	Other Single-vehicle Collision	0.03	1.4	0.04	1.6	0.07	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.17	7.6	0.41	18.9	0.58	26.5
Highway Segment	Right-Angle Collision	0.01	0.3	0.02	0.8	0.03	1.2
Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.01	0.3
Highway Segment	Other Multi-vehicle Collision	0.01	0.5	0.03	1.1	0.04	1.6
Highway Segment	Rear-end Collision	0.35	16.1	0.87	40.0	1.22	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.10	4.6	0.21	9.8	0.31	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.47	21.6	1.13	51.8	1.60	73.5
Highway Segment	Total Highway Segment Crashes	0.64	29.3	1.54	70.7	2.18	100.0
	Total Crashes	0.64	29.3	1.54	70.7	2.18	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 14. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1188+09.855	1205+10.860	Information: for segment #1 (1188+09.855 to 1205+10.860), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1205+10.860	1207+25.110	Information: for segment #2 (1205+10.860 to 1207+25.110), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1207+25.110	1223+65.390	Information: for segment #3 (1207+25.110 to 1223+65.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1223+65.390	1245+66.480	Information: for segment #4 (1223+65.390 to 1245+66.480), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1245+66.480	1261+30.760	Information: for segment #6 (1245+66.480 to 1261+30.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1245+66.480	1261+30.760	Information: for segment #6 (1245+66.480 to 1261+30.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1270+54.855	1271+54.640	Information: for segment #13 (1270+54.855 to 1271+54.640), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1270+54.855	1271+54.640	Information: for segment #13 (1270+54.855 to 1271+54.640), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1270+54.855	1271+54.640	Information: for segment #13 (1270+54.855 to 1271+54.640), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1271+54.640	1272+14.320	Information: for segment #14 (1271+54.640 to 1272+14.320), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1271+54.640	1272+14.320	Information: for segment #14 (1271+54.640 to 1272+14.320), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1271+54.640	1272+14.320	Information: for segment #14 (1271+54.640 to 1272+14.320), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1271+54.640	1272+14.320	Information: for segment #14 (1271+54.640 to 1272+14.320), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1272+14.320	1293+09.460	Information: for segment #15 (1272+14.320 to 1293+09.460), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1272+14.320	1293+09.460	Information: for segment #15 (1272+14.320 to 1293+09.460), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1272+14.320	1293+09.460	Information: for segment #15 (1272+14.320 to 1293+09.460), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1272+14.320	1293+09.460	Information: for segment #15 (1272+14.320 to 1293+09.460), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1272+14.320	1293+09.460	Information: for segment #15 (1272+14.320 to 1293+09.460), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+09.460	1293+14.390	Information: for segment #16 (1293+09.460 to 1293+14.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+09.460	1293+14.390	Information: for segment #16 (1293+09.460 to 1293+14.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+09.460	1293+14.390	Information: for segment #16 (1293+09.460 to 1293+14.390), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+09.460	1293+14.390	Information: for segment #16 (1293+09.460 to 1293+14.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+09.460	1293+14.390	Information: for segment #16 (1293+09.460 to 1293+14.390), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+14.390	1294+72.855	Information: for segment #17 (1293+14.390 to 1294+72.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+14.390	1294+72.855	Information: for segment #17 (1293+14.390 to 1294+72.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+14.390	1294+72.855	Information: for segment #17 (1293+14.390 to 1294+72.855), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1293+14.390	1294+72.855	Information: for segment #17 (1293+14.390 to 1294+72.855), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1294+72.855	1295+18.855	Information: for segment #18 (1294+72.855 to 1295+18.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1294+72.855	1295+18.855	Information: for segment #18 (1294+72.855 to 1295+18.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

1295+18.855	1296+07.680	Information: for segment #19 (1295+18.855 to 1296+07.680), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1308+33.680	1308+85.530	Information: for segment #25 (1308+33.680 to 1308+85.530), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1308+85.530	1310+05.140	Information: for segment #26 (1308+85.530 to 1310+05.140), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1310+05.140	1310+93.940	Information: for segment #27 (1310+05.140 to 1310+93.940), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1310+93.940	1311+04.140	Information: for segment #28 (1310+93.940 to 1311+04.140), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Buffer Separated GP+ML
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 4
Evaluation Comment: Created Thu Jun 23 12:38:39 CDT 2022

Minimum Location: 1340+47.770
Maximum Location: 1418+65.083

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1340+47.770
Evaluation End Location: 1418+65.083
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EN=1.0; FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EN=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

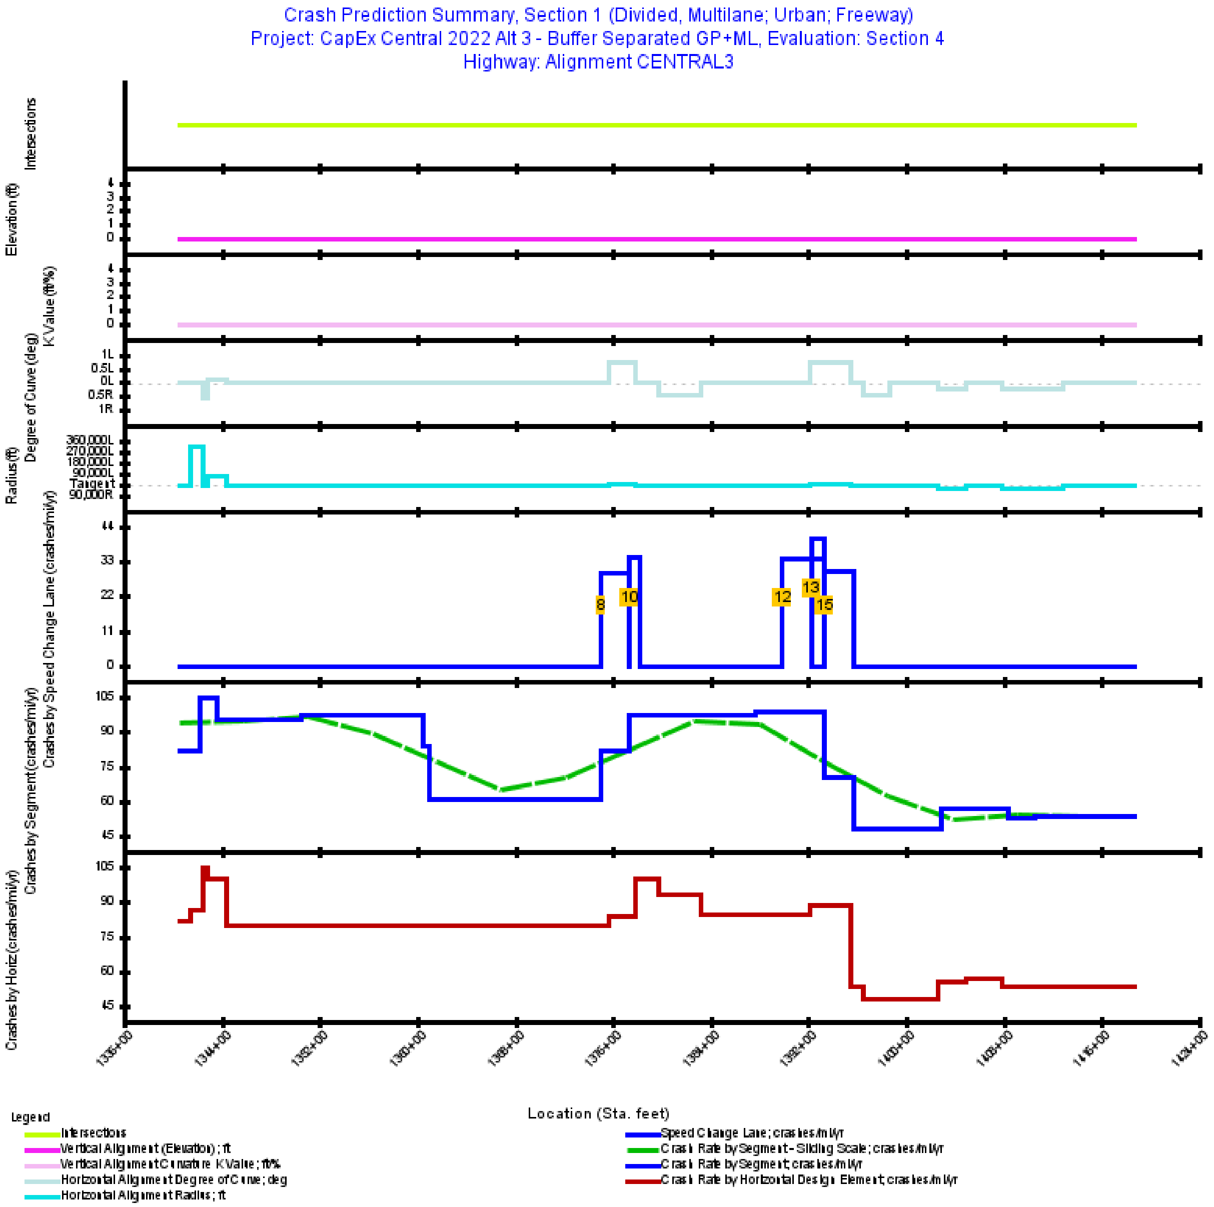

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1340+47.770	1342+19.830	172.06	0.0326	2030: 183,600	2.00	Non-Traversable Median	10.52
2	Ten-lane Freeway	Urban	1342+19.830	1343+64.770	144.94	0.0275	2030: 190,950	4.03	Non-Traversable Median	12.03
3	Ten-lane Freeway	Urban	1343+64.770	1350+54.770	690.00	0.1307	2030: 190,950	6.00	Non-Traversable Median	12.99
4	Ten-lane Freeway	Urban	1350+54.770	1360+43.040	988.27	0.1872	2030: 190,950	2.00	Non-Traversable Median	11.48
5	Ten-lane Freeway	Urban	1360+43.040	1361+03.200	60.16	0.0114	2030: 178,550	2.00	Non-Traversable Median	10.00

Table 4. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.3840**
Average Future Road AADT (vpd)	**173,767**
Predicted Crashes	
Total Crashes	**103.91**
Fatal and Injury Crashes	**30.18**
Property-Damage-Only Crashes	**73.73**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**75.0808**
FI Crash Rate (crashes/mi/yr)	**21.8064**
PDO Crash Rate (crashes/mi/yr)	**53.2744**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**87.78**
Travel Crash Rate (crashes/million veh-mi)	**1.18**
Travel FI Crash Rate (crashes/million veh-mi)	**0.34**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.84**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 5. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.1932**
Average Future Road AADT (vpd)	**95,699**
Predicted Crashes	
Total Crashes	**6.30**
Fatal and Injury Crashes	**2.02**
Property-Damage-Only Crashes	**4.28**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**32**
Percent Property-Damage-Only Crashes (%)	**68**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**32.6168**
FI Crash Rate (crashes/mi/yr)	**10.4663**
PDO Crash Rate (crashes/mi/yr)	**22.1504**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**6.75**
Travel Crash Rate (crashes/million veh-mi)	**0.93**
Travel FI Crash Rate (crashes/million veh-mi)	**0.30**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.63**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 6. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Highway Segment	Collision with Parked Vehicle	0.17	0.2	0.46	0.4	0.63	0.6
Highway Segment	Total Single Vehicle Crashes	11.48	11.0	28.53	27.5	40.01	38.5
Highway Segment	Right-Angle Collision	0.58	0.6	0.81	0.8	1.39	1.3
Highway Segment	Head-on Collision	0.15	0.1	0.09	0.1	0.24	0.2
Highway Segment	Other Multi-vehicle Collision	0.58	0.6	1.08	1.0	1.67	1.6
Highway Segment	Rear-end Collision	14.03	13.5	31.19	30.0	45.22	43.5
Highway Segment	Sideswipe, Same Direction Collision	3.37	3.2	12.02	11.6	15.39	14.8
Highway Segment	Total Multiple Vehicle Crashes	18.70	18.0	45.20	43.5	63.90	61.5
Highway Segment	Total Highway Segment Crashes	30.18	29.0	73.73	71.0	103.91	100.0
	Total Crashes	30.18	29.0	73.73	71.0	103.91	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Predicted Exit Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.02	0.5	0.02	0.5
Highway Segment	Collision with Fixed Object	0.24	5.9	0.59	14.5	0.83	20.4
Highway Segment	Collision with Other Object	0.02	0.5	0.09	2.1	0.10	2.6
Highway Segment	Other Single-vehicle Collision	0.06	1.5	0.07	1.6	0.13	3.1
Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.32	7.9	0.76	18.6	1.08	26.5
Highway Segment	Right-Angle Collision	0.01	0.3	0.03	0.8	0.05	1.2
Highway Segment	Head-on Collision	0.01	0.2	0.01	0.1	0.01	0.3
Highway Segment	Other Multi-vehicle Collision	0.02	0.5	0.05	1.1	0.07	1.6
Highway Segment	Rear-end Collision	0.68	16.6	1.61	39.4	2.29	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.20	4.8	0.39	9.6	0.59	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.91	22.3	2.09	51.2	3.00	73.5
Highway Segment	Total Highway Segment Crashes	1.23	30.2	2.85	69.8	4.09	100.0
	Total Crashes	1.23	30.2	2.85	69.8	4.09	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 14. Predicted Entrance Speed Change Lane Crash Type Distribution (Speed Change)

Element Type	Crash Type	FI Crashes	Percent FI (%)	PDO Crashes	Percent PDO (%)	Total Crashes	Percent Total (%)
Highway Segment	Collision with Animal	0.00	0.0	0.00	0.1	0.00	0.1
Highway Segment	Collision with Fixed Object	0.15	6.9	0.18	8.3	0.34	15.2
Highway Segment	Collision with Other Object	0.01	0.7	0.05	2.3	0.07	3.0
Highway Segment	Other Single-vehicle Collision	0.05	2.4	0.02	1.0	0.08	3.4
Highway Segment	Collision with Parked Vehicle	0.00	0.1	0.00	0.2	0.01	0.3
Highway Segment	Total Single Vehicle Crashes	0.22	10.1	0.27	12.0	0.49	22.1
Highway Segment	Right-Angle Collision	0.01	0.7	0.02	1.0	0.04	1.7
Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.01	0.2
Highway Segment	Other Multi-vehicle Collision	0.01	0.6	0.02	1.0	0.04	1.6
Highway Segment	Rear-end Collision	0.43	19.3	0.76	34.1	1.18	53.5
Highway Segment	Sideswipe, Same Direction Collision	0.10	4.7	0.36	16.2	0.46	21.0
Highway Segment	Total Multiple Vehicle Crashes	0.56	25.5	1.16	52.4	1.73	77.9
Highway Segment	Total Highway Segment Crashes	0.79	35.6	1.43	64.4	2.21	100.0
	Total Crashes	0.79	35.6	1.43	64.4	2.21	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 15. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1340+47.770	1342+19.830	Information: for segment #1 (1340+47.770 to 1342+19.830), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+47.770	1342+19.830	Information: for segment #1 (1340+47.770 to 1342+19.830), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+47.770	1342+19.830	Information: for segment #1 (1340+47.770 to 1342+19.830), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1340+47.770	1342+19.830	Information: for segment #1 (1340+47.770 to 1342+19.830), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+64.770	Information: for segment #2 (1342+19.830 to 1343+64.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+64.770	Information: for segment #2 (1342+19.830 to 1343+64.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+64.770	Information: for segment #2 (1342+19.830 to 1343+64.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1342+19.830	1343+64.770	Information: for segment #2 (1342+19.830 to 1343+64.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+64.770	1350+54.770	Information: for segment #3 (1343+64.770 to 1350+54.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+64.770	1350+54.770	Information: for segment #3 (1343+64.770 to 1350+54.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+64.770	1350+54.770	Information: for segment #3 (1343+64.770 to 1350+54.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1343+64.770	1350+54.770	Information: for segment #3 (1343+64.770 to 1350+54.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1350+54.770	1360+43.040	Information: for segment #4 (1350+54.770 to 1360+43.040), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1350+54.770	1360+43.040	Information: for segment #4 (1350+54.770 to 1360+43.040), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1350+54.770	1360+43.040	Information: for segment #4 (1350+54.770 to 1360+43.040), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1350+54.770	1360+43.040	Information: for segment #4 (1350+54.770 to 1360+43.040), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+43.040	1361+03.200	Information: for segment #5 (1360+43.040 to 1361+03.200), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+43.040	1361+03.200	Information: for segment #5 (1360+43.040 to 1361+03.200), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+43.040	1361+03.200	Information: for segment #5 (1360+43.040 to 1361+03.200), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1360+43.040	1361+03.200	Information: for segment #5 (1360+43.040 to 1361+03.200), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1361+03.200	1375+05.490	Information: for segment #6 (1361+03.200 to 1375+05.490), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1361+03.200	1375+05.490	Information: for segment #6 (1361+03.200 to 1375+05.490), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1361+03.200	1375+05.490	Information: for segment #6 (1361+03.200 to 1375+05.490), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Phone:
E-Mail:

Project Title: CapEx Central 2022 Alt 3 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 1
Evaluation Comment: Created Thu Jun 23 12:41:26 CDT 2022

Minimum Location: 1055+87.420
Maximum Location: 1137+45.515

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1055+87.420
Evaluation End Location: 1137+45.515
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

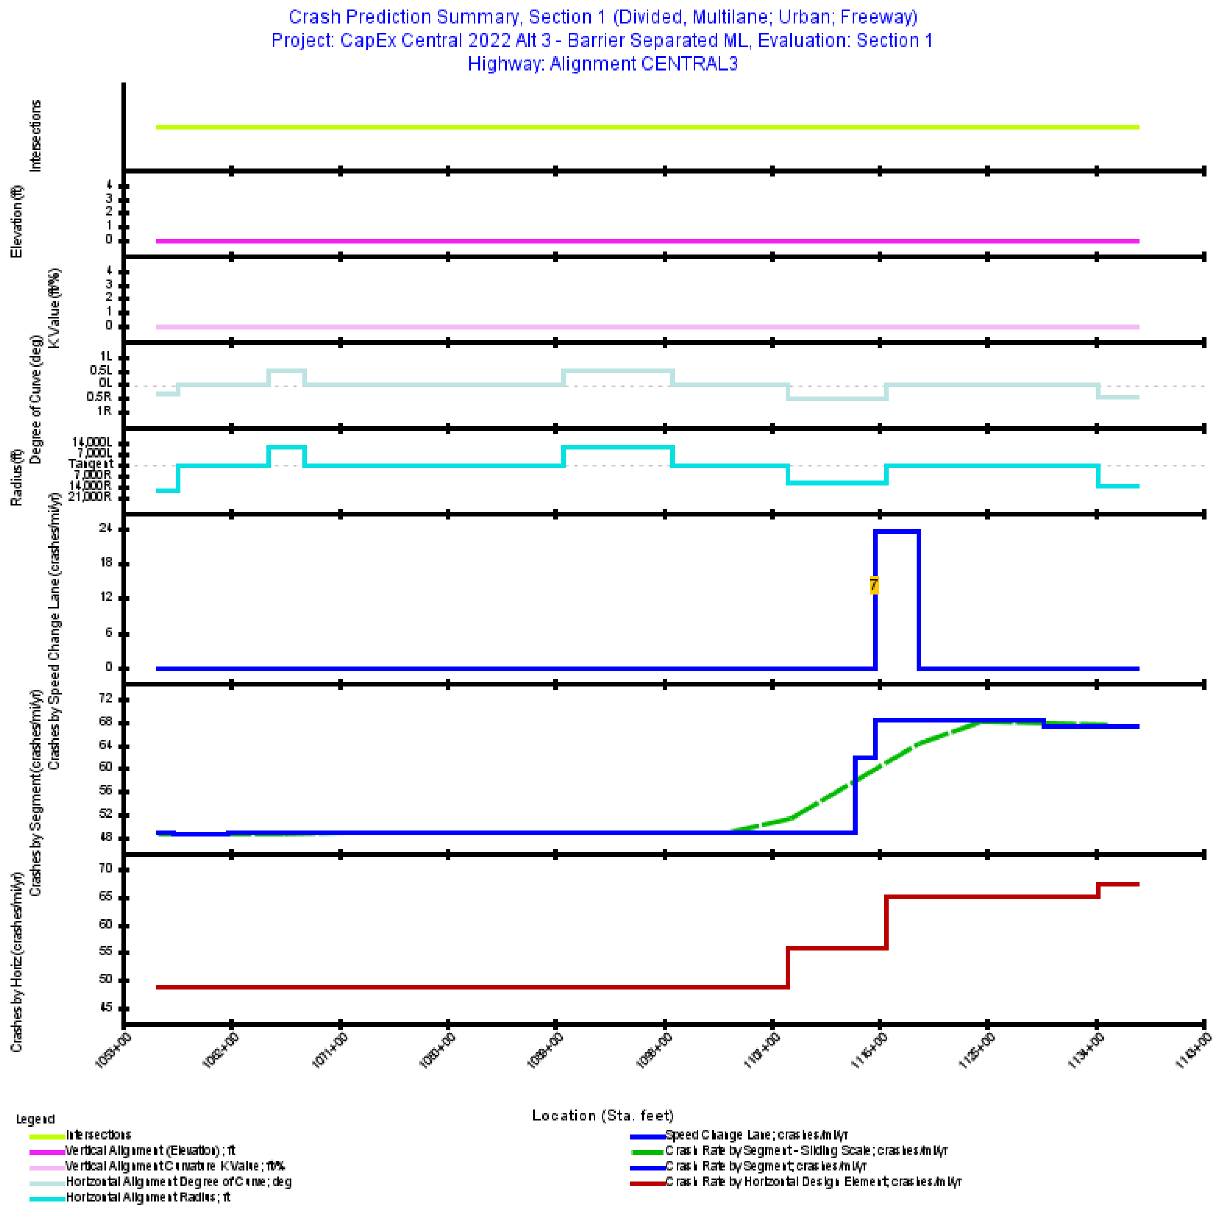

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Eight-lane Freeway	Urban	1055+87.420	1057+23.420	136.00	0.0258	2030: 143,650	63.51	Non-Traversable Median	71.51
2	Eight-lane Freeway	Urban	1057+23.420	1061+73.420	450.00	0.0852	2030: 143,650	70.01	Non-Traversable Median	78.01
3	Eight-lane Freeway	Urban	1061+73.420	1070+03.420	830.00	0.1572	2030: 143,650	79.45	Non-Traversable Median	88.01
4	Eight-lane Freeway	Urban	1070+03.420	1113+93.760	4,390.34	0.8315	2030: 143,650	87.00	Non-Traversable Median	94.01
5	Nine-lane Freeway	Urban	1113+93.760	1115+60.130	166.37	0.0315	2030: 165,550	87.00	Non-Traversable Median	95.00
6	Nine-lane Freeway	Urban	1115+60.130	1129+72.250	1,412.12	0.2674	2030: 184,050	87.00	Non-Traversable Median	95.00
8	Ten-lane Freeway	Urban	1129+72.250	1137+45.515	773.26	0.1465	2030: 189,850	87.00	Non-Traversable Median	95.00

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
7	Nine-lane Freeway Speed Change	Exit	1115+60.130	1119+25.130	365.00	0.0691	2030: 184,050	87.00	Non-Traversable Median	95.00

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**1.5105**
Average Future Road AADT (vpd)	**154,815**
Predicted Crashes	
Total Crashes	**81.39**
Fatal and Injury Crashes	**23.40**
Property-Damage-Only Crashes	**57.99**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**53.8831**
FI Crash Rate (crashes/mi/yr)	**15.4890**
PDO Crash Rate (crashes/mi/yr)	**38.3941**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**85.36**
Travel Crash Rate (crashes/million veh-mi)	**0.95**
Travel FI Crash Rate (crashes/million veh-mi)	**0.27**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.68**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0691**
Average Future Road AADT (vpd)	**92,025**
Predicted Crashes	
Total Crashes	**1.64**
Fatal and Injury Crashes	**0.49**
Property-Damage-Only Crashes	**1.15**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**23.7191**
FI Crash Rate (crashes/mi/yr)	**7.1036**
PDO Crash Rate (crashes/mi/yr)	**16.6155**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**2.32**
Travel Crash Rate (crashes/million veh-mi)	**0.71**
Travel FI Crash Rate (crashes/million veh-mi)	**0.21**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.50**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1055+87.420	1057+23.420	0.0258	1.259	1.2590	0.3646	0.8944	48.8806	0.93
2	1057+23.420	1061+73.420	0.0852	4.146	4.1459	1.2014	2.9445	48.6450	0.93
3	1061+73.420	1070+03.420	0.1572	7.676	7.6760	2.2232	5.4528	48.8304	0.93
4	1070+03.420	1113+93.760	0.8315	40.589	40.5893	11.7566	28.8327	48.8143	0.93
5	1113+93.760	1115+60.130	0.0315	1.946	1.9458	0.5602	1.3857	61.7542	1.02
6	1115+60.130	1129+72.250	0.2329	15.922	15.9218	4.4709	11.4508	68.3683	1.02
8	1129+72.250	1137+45.515	0.1465	9.854	9.8542	2.8198	7.0345	67.2866	0.97
Total			1.5105	81.392	81.3921	23.3966	57.9954	53.8831	0.95

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 6. Predicted Crash Frequencies and Rates by Freeway Speed Change Lane (Speed Change)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
7	1115+60.130	1119+25.130	0.0691	1.640	1.6397	0.4911	1.1486	23.7191	0.71
Total			0.0691	1.640	1.6397	0.4911	1.1486	23.7191	0.71

Note: *Travel Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

1061+73.420	1070+03.420	Information: for segment #3 (1061+73.420 to 1070+03.420), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1061+73.420	1070+03.420	Information: for segment #3 (1061+73.420 to 1070+03.420), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1061+73.420	1070+03.420	Information: for segment #3 (1061+73.420 to 1070+03.420), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1070+03.420	1113+93.760	Information: for segment #4 (1070+03.420 to 1113+93.760), Effective median width (94.01 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1070+03.420	1113+93.760	Information: for segment #4 (1070+03.420 to 1113+93.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1070+03.420	1113+93.760	Information: for segment #4 (1070+03.420 to 1113+93.760), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1070+03.420	1113+93.760	Information: for segment #4 (1070+03.420 to 1113+93.760), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1070+03.420	1113+93.760	Information: for segment #4 (1070+03.420 to 1113+93.760), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+93.760	1115+60.130	Information: for segment #5 (1113+93.760 to 1115+60.130), Effective median width (95.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1113+93.760	1115+60.130	Information: for segment #5 (1113+93.760 to 1115+60.130), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+93.760	1115+60.130	Information: for segment #5 (1113+93.760 to 1115+60.130), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+93.760	1115+60.130	Information: for segment #5 (1113+93.760 to 1115+60.130), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+93.760	1115+60.130	Information: for segment #5 (1113+93.760 to 1115+60.130), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1115+60.130	1129+72.250	Information: for segment #6 (1115+60.130 to 1129+72.250), Effective median width (95.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1115+60.130	1129+72.250	Information: for segment #6 (1115+60.130 to 1129+72.250), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1115+60.130	1129+72.250	Information: for segment #6 (1115+60.130 to 1129+72.250), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1115+60.130	1129+72.250	Information: for segment #6 (1115+60.130 to 1129+72.250), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1115+60.130	1129+72.250	Information: for segment #6 (1115+60.130 to 1129+72.250), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+72.250	1137+45.515	Information: for segment #8 (1129+72.250 to 1137+45.515), Effective median width (95.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1129+72.250	1137+45.515	Information: for segment #8 (1129+72.250 to 1137+45.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+72.250	1137+45.515	Information: for segment #8 (1129+72.250 to 1137+45.515), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+72.250	1137+45.515	Information: for segment #8 (1129+72.250 to 1137+45.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1129+72.250	1137+45.515	Information: for segment #8 (1129+72.250 to 1137+45.515), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1115+60.130	1119+25.130	Information: for segment #7 (1115+60.130 to 1119+25.130), For Speed Change Lane the Effective median width (95.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1115+60.130	1119+25.130	Information: for segment #7 (1115+60.130 to 1119+25.130), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1113+93.760	1115+60.130	Information: for segment #5 (1113+93.760 to 1115+60.130), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1115+60.130	1129+72.250	Information: for segment #6 (1115+60.130 to 1129+72.250), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1115+60.130	1119+25.130	Information: for segment #7 (1115+60.130 to 1119+25.130), Speed Change Segment of type Nine-lane Freeway Speed Change is using unbalanced lane processing with types Eight-lane Freeway Speed Change and Ten-lane Freeway Speed Change

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 2
Evaluation Comment: Created Thu Jun 23 12:42:59 CDT 2022

Minimum Location: 1161+05.035
Maximum Location: 1188+09.855

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1161+05.035
Evaluation End Location: 1188+09.855
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_EX=1.0; FI_MV=1.0; FI_SV=1.0; PDO_EX=1.0; PDO_MV=1.0; PDO_SV=1.0;

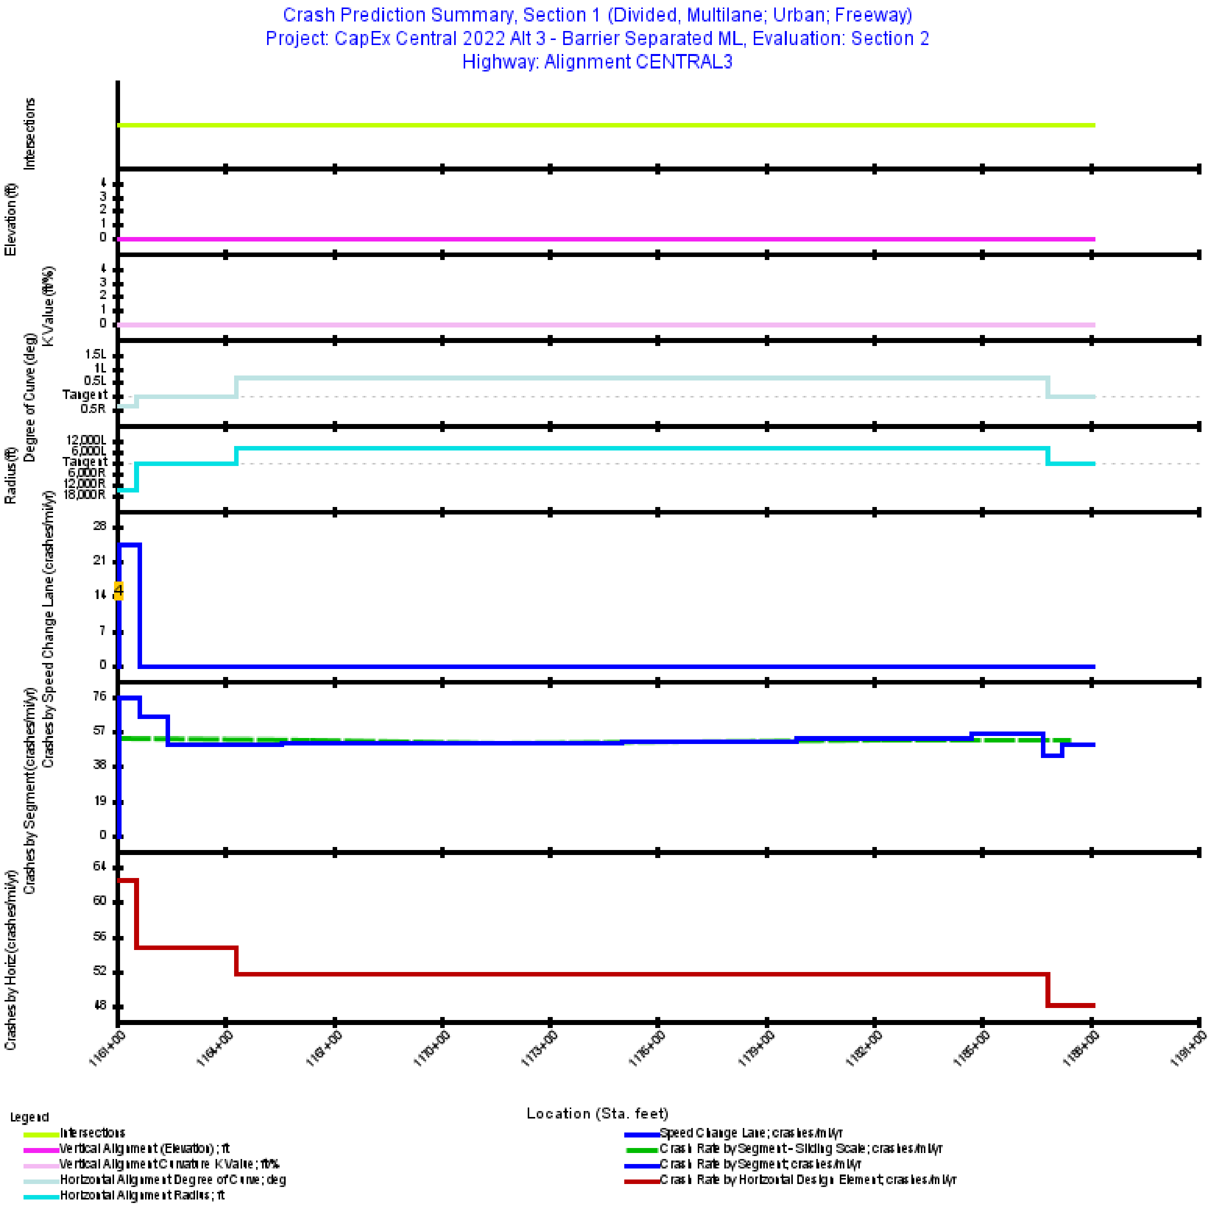

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Ten-lane Freeway	Urban	1161+05.035	1161+05.040	0.01	0.0000	2030: 189,850	106.00	Non-Traversable Median	114.00
3	Ten-lane Freeway	Urban	1161+05.040	1161+63.210	58.17	0.0110	2030: 189,850	107.22	Non-Traversable Median	115.22
5	Nine-lane Freeway	Urban	1161+63.210	1162+39.850	76.64	0.0145	2030: 173,600	110.05	Non-Traversable Median	118.05
6	Eight-lane Freeway	Urban	1162+39.850	1163+20.035	80.19	0.0152	2030: 145,650	113.34	Non-Traversable Median	121.34
7	Eight-lane Freeway	Urban	1163+20.035	1165+58.035	238.00	0.0451	2030: 145,650	120.02	Non-Traversable Median	128.02
8	Eight-lane Freeway	Urban	1165+58.035	1167+96.035	238.00	0.0451	2030: 145,650	130.02	Non-Traversable Median	138.02
9	Eight-lane Freeway	Urban	1167+96.035	1170+13.035	217.00	0.0411	2030: 145,650	137.23	Non-Traversable Median	143.01
10	Eight-lane Freeway	Urban	1170+13.035	1174+99.035	486.00	0.0920	2030: 145,650	129.99	Non-Traversable Median	137.99
11	Eight-lane Freeway	Urban	1174+99.035	1179+85.035	486.00	0.0920	2030: 145,650	119.99	Non-Traversable Median	127.99
12	Eight-lane Freeway	Urban	1179+85.035	1184+70.035	485.00	0.0919	2030: 145,650	109.99	Non-Traversable Median	117.99

Table 2. Evaluation Freeway - Speed Change Lanes (Speed Change)

Seg. No.	Type	Ramp Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
2	Ten-lane Freeway Speed Change	Exit	1161+05.035	1161+05.040	0.01	0.0000	2030: 189,850	106.00	Non-Traversable Median	114.00
4	Ten-lane Freeway Speed Change	Exit	1161+05.040	1161+63.210	58.17	0.0110	2030: 189,850	107.22	Non-Traversable Median	115.22

Table 3. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.5068**
Average Future Road AADT (vpd)	**146,197**
Predicted Crashes	
Total Crashes	**26.41**
Fatal and Injury Crashes	**7.62**
Property-Damage-Only Crashes	**18.79**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**52.1255**
FI Crash Rate (crashes/mi/yr)	**15.0413**
PDO Crash Rate (crashes/mi/yr)	**37.0842**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**27.04**
Travel Crash Rate (crashes/million veh-mi)	**0.98**
Travel FI Crash Rate (crashes/million veh-mi)	**0.28**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.69**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Table 4. Predicted Freeway Speed Change Lane Crash Rates and Frequencies Summary (Speed Change)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Length (mi)	**0.0110**
Average Future Road AADT (vpd)	**94,925**
Predicted Crashes	
Total Crashes	**0.27**
Fatal and Injury Crashes	**0.08**
Property-Damage-Only Crashes	**0.19**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**30**
Percent Property-Damage-Only Crashes (%)	**70**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**24.4262**
FI Crash Rate (crashes/mi/yr)	**7.2950**
PDO Crash Rate (crashes/mi/yr)	**17.1312**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**0.38**
Travel Crash Rate (crashes/million veh-mi)	**0.70**
Travel FI Crash Rate (crashes/million veh-mi)	**0.21**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.49**

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 5. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1161+05.035	1161+05.040	0.0000	0.000	0.0000	0.0000	0.0000	0.0000	0.00
3	1161+05.040	1161+63.210	0.0055	0.418	0.4184	0.1199	0.2985	75.9591	1.10
5	1161+63.210	1162+39.850	0.0145	0.954	0.9536	0.2717	0.6820	65.7000	1.04

Highway Segment	Collision with Parked Vehicle	0.00	0.0	0.00	0.0	0.00	0.0
Highway Segment	Total Single Vehicle Crashes	0.02	7.8	0.05	18.7	0.07	26.5
Highway Segment	Right-Angle Collision	0.00	0.3	0.00	0.8	0.00	1.2
Highway Segment	Head-on Collision	0.00	0.1	0.00	0.1	0.00	0.3
Highway Segment	Other Multi-vehicle Collision	0.00	0.5	0.00	1.1	0.00	1.6
Highway Segment	Rear-end Collision	0.04	16.4	0.11	39.6	0.15	56.0
Highway Segment	Sideswipe, Same Direction Collision	0.01	4.7	0.03	9.7	0.04	14.4
Highway Segment	Total Multiple Vehicle Crashes	0.06	22.1	0.14	51.4	0.20	73.5
Highway Segment	Total Highway Segment Crashes	0.08	29.9	0.19	70.1	0.27	100.0
	Total Crashes	0.08	29.9	0.19	70.1	0.27	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 13. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1161+05.035	1161+05.040	Information: for segment #1 (1161+05.035 to 1161+05.040), Effective median width (114.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+05.035	1161+05.040	Information: for segment #1 (1161+05.035 to 1161+05.040), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.035	1161+05.040	Information: for segment #1 (1161+05.035 to 1161+05.040), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.035	1161+05.040	Information: for segment #1 (1161+05.035 to 1161+05.040), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.035	1161+05.040	Information: for segment #1 (1161+05.035 to 1161+05.040), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #3 (1161+05.040 to 1161+63.210), Effective median width (115.22 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #3 (1161+05.040 to 1161+63.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #3 (1161+05.040 to 1161+63.210), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #3 (1161+05.040 to 1161+63.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #3 (1161+05.040 to 1161+63.210), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.210	1162+39.850	Information: for segment #5 (1161+63.210 to 1162+39.850), Effective median width (118.05 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+63.210	1162+39.850	Information: for segment #5 (1161+63.210 to 1162+39.850), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.210	1162+39.850	Information: for segment #5 (1161+63.210 to 1162+39.850), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.210	1162+39.850	Information: for segment #5 (1161+63.210 to 1162+39.850), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.210	1162+39.850	Information: for segment #5 (1161+63.210 to 1162+39.850), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+39.850	1163+20.035	Information: for segment #6 (1162+39.850 to 1163+20.035), Effective median width (121.34 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1162+39.850	1163+20.035	Information: for segment #6 (1162+39.850 to 1163+20.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+39.850	1163+20.035	Information: for segment #6 (1162+39.850 to 1163+20.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+39.850	1163+20.035	Information: for segment #6 (1162+39.850 to 1163+20.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1162+39.850	1163+20.035	Information: for segment #6 (1162+39.850 to 1163+20.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1163+20.035	1165+58.035	Information: for segment #7 (1163+20.035 to 1165+58.035), Effective median width (128.02 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1163+20.035	1165+58.035	Information: for segment #7 (1163+20.035 to 1165+58.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1163+20.035	1165+58.035	Information: for segment #7 (1163+20.035 to 1165+58.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1163+20.035	1165+58.035	Information: for segment #7 (1163+20.035 to 1165+58.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1163+20.035	1165+58.035	Information: for segment #7 (1163+20.035 to 1165+58.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1165+58.035	1167+96.035	Information: for segment #8 (1165+58.035 to 1167+96.035), Effective median width (138.02 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1165+58.035	1167+96.035	Information: for segment #8 (1165+58.035 to 1167+96.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1165+58.035	1167+96.035	Information: for segment #8 (1165+58.035 to 1167+96.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1165+58.035	1167+96.035	Information: for segment #8 (1165+58.035 to 1167+96.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1165+58.035	1167+96.035	Information: for segment #8 (1165+58.035 to 1167+96.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1167+96.035	1170+13.035	Information: for segment #9 (1167+96.035 to 1170+13.035), Effective median width (143.01 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1167+96.035	1170+13.035	Information: for segment #9 (1167+96.035 to 1170+13.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1167+96.035	1170+13.035	Information: for segment #9 (1167+96.035 to 1170+13.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1167+96.035	1170+13.035	Information: for segment #9 (1167+96.035 to 1170+13.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1167+96.035	1170+13.035	Information: for segment #9 (1167+96.035 to 1170+13.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1170+13.035	1174+99.035	Information: for segment #10 (1170+13.035 to 1174+99.035), Effective median width (137.99 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1170+13.035	1174+99.035	Information: for segment #10 (1170+13.035 to 1174+99.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1170+13.035	1174+99.035	Information: for segment #10 (1170+13.035 to 1174+99.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1170+13.035	1174+99.035	Information: for segment #10 (1170+13.035 to 1174+99.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1170+13.035	1174+99.035	Information: for segment #10 (1170+13.035 to 1174+99.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1174+99.035	1179+85.035	Information: for segment #11 (1174+99.035 to 1179+85.035), Effective median width (127.99 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1174+99.035	1179+85.035	Information: for segment #11 (1174+99.035 to 1179+85.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1174+99.035	1179+85.035	Information: for segment #11 (1174+99.035 to 1179+85.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1174+99.035	1179+85.035	Information: for segment #11 (1174+99.035 to 1179+85.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1174+99.035	1179+85.035	Information: for segment #11 (1174+99.035 to 1179+85.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1179+85.035	1184+70.035	Information: for segment #12 (1179+85.035 to 1184+70.035), Effective median width (117.99 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1179+85.035	1184+70.035	Information: for segment #12 (1179+85.035 to 1184+70.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1179+85.035	1184+70.035	Information: for segment #12 (1179+85.035 to 1184+70.035), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1179+85.035	1184+70.035	Information: for segment #12 (1179+85.035 to 1184+70.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1179+85.035	1184+70.035	Information: for segment #12 (1179+85.035 to 1184+70.035), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1184+70.035	1186+67.880	Information: for segment #13 (1184+70.035 to 1186+67.880), Effective median width (110.96 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1184+70.035	1186+67.880	Information: for segment #13 (1184+70.035 to 1186+67.880), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1184+70.035	1186+67.880	Information: for segment #13 (1184+70.035 to 1186+67.880), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1184+70.035	1186+67.880	Information: for segment #13 (1184+70.035 to 1186+67.880), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1184+70.035	1186+67.880	Information: for segment #13 (1184+70.035 to 1186+67.880), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+67.880	1187+20.830	Information: for segment #14 (1186+67.880 to 1187+20.830), Effective median width (108.38 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1186+67.880	1187+20.830	Information: for segment #14 (1186+67.880 to 1187+20.830), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+67.880	1187+20.830	Information: for segment #14 (1186+67.880 to 1187+20.830), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+67.880	1187+20.830	Information: for segment #14 (1186+67.880 to 1187+20.830), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1186+67.880	1187+20.830	Information: for segment #14 (1186+67.880 to 1187+20.830), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1187+20.830	1188+09.855	Information: for segment #15 (1187+20.830 to 1188+09.855), Effective median width (106.92 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1187+20.830	1188+09.855	Information: for segment #15 (1187+20.830 to 1188+09.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1187+20.830	1188+09.855	Information: for segment #15 (1187+20.830 to 1188+09.855), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1187+20.830	1188+09.855	Information: for segment #15 (1187+20.830 to 1188+09.855), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1187+20.830	1188+09.855	Information: for segment #15 (1187+20.830 to 1188+09.855), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.035	1161+05.040	Information: for segment #2 (1161+05.035 to 1161+05.040), For Speed Change Lane the Effective median width (114.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+05.035	1161+05.040	Information: for segment #2 (1161+05.035 to 1161+05.040), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #4 (1161+05.040 to 1161+63.210), For Speed Change Lane the Effective median width (115.22 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1161+05.040	1161+63.210	Information: for segment #4 (1161+05.040 to 1161+63.210), For Speed Change Lane the median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1161+63.210	1162+39.850	Information: for segment #5 (1161+63.210 to 1162+39.850), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1186+67.880	1187+20.830	Information: for segment #14 (1186+67.880 to 1187+20.830), Freeway Segment of type Seven-lane Freeway is using unbalanced lane processing with types Six-lane Freeway and Eight-lane Freeway
1187+20.830	1188+09.855	Warning: for segment #15 (1187+20.830 to 1188+09.855), Freeway Segment of type 8F is using unbalanced lane processing with 3 + 5 lanes. While results are provided, the HSM specifies that this approach only applies when the number of lanes varies by no more than one lane between the two travel directions.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment CENTRAL3
Highway Comment: Imported from CENTRAL3.xml
Highway Version: 1

Evaluation Title: Section 3
Evaluation Comment: Created Thu Jun 23 12:46:13 CDT 2022

Minimum Location: 1317+43.705
Maximum Location: 1340+47.770

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Section 1 Evaluation

Section: Section 1
Evaluation Start Location: 1317+43.705
Evaluation End Location: 1340+47.770
Functional Class: Freeway
Type of Alignment: Divided, Multilane
Model Category: Freeway Segment
Calibration Factor: FI_MV=1.0; FI_SV=1.0; PDO_MV=1.0; PDO_SV=1.0;

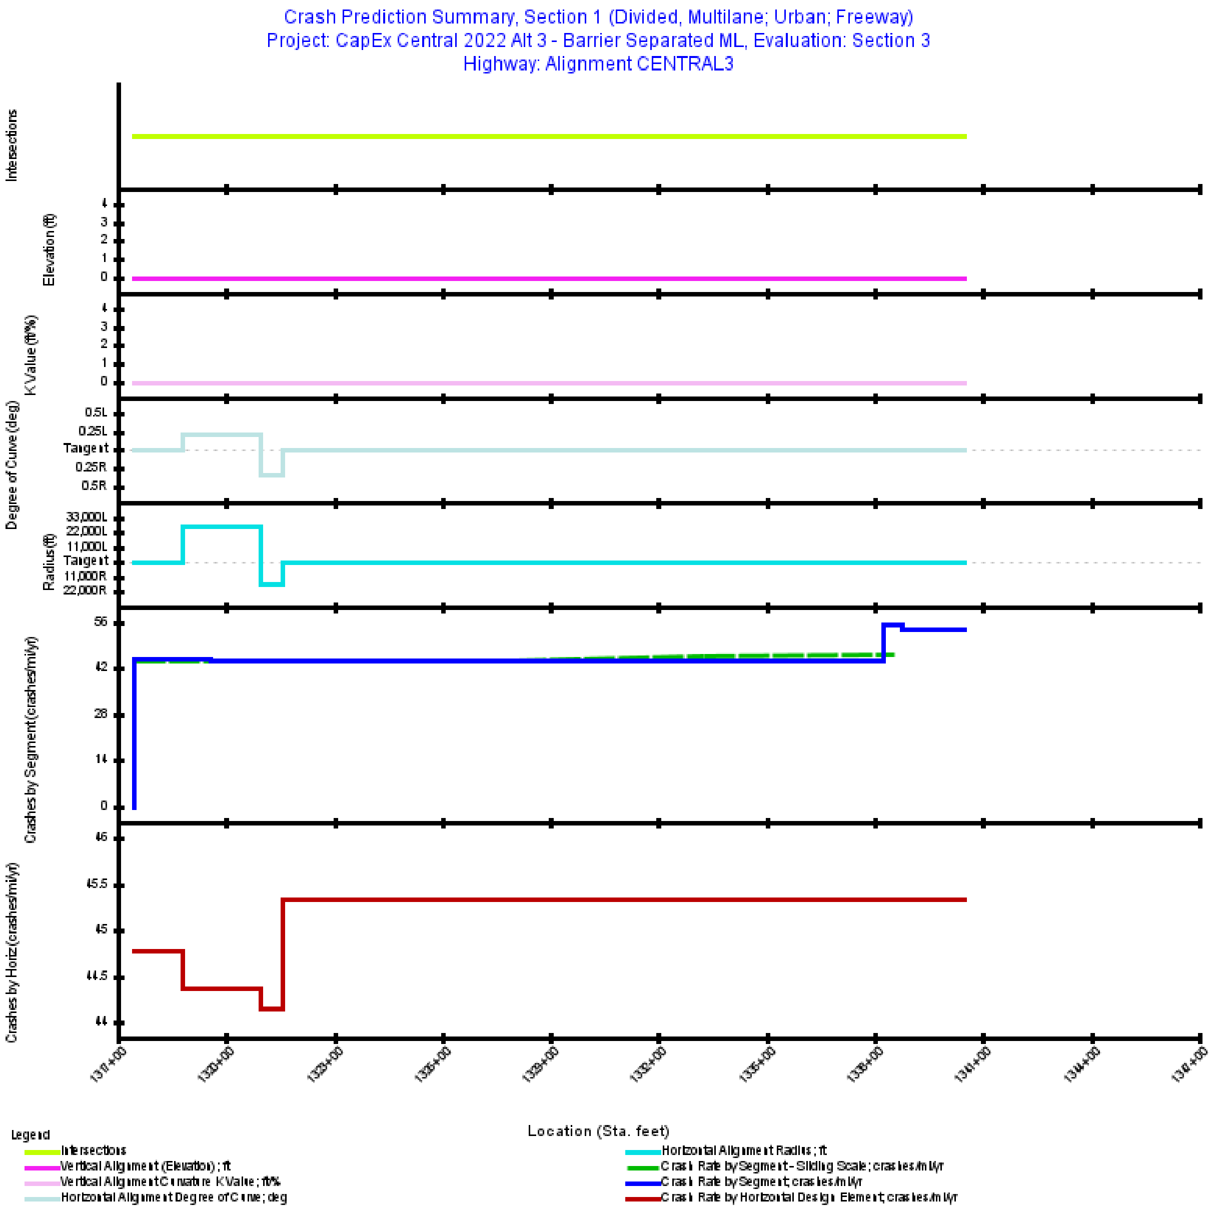

Figure 1. Crash Prediction Summary (Section 1)

Table 1. Evaluation Freeway - Homogeneous Segments (Section 1)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT	Median Width (ft)	Type	Effective Median Width (ft)
1	Eight-lane Freeway	Urban	1317+43.705	1317+43.710	0.01	0.0000	2030: 143,150	82.00	Non-Traversable Median	102.00
2	Eight-lane Freeway	Urban	1317+43.710	1319+57.705	214.00	0.0405	2030: 143,150	83.50	Non-Traversable Median	103.50
3	Eight-lane Freeway	Urban	1319+57.705	1338+21.560	1,863.86	0.3530	2030: 143,150	89.00	Non-Traversable Median	105.64
4	Nine-lane Freeway	Urban	1338+21.560	1338+76.705	55.14	0.0104	2030: 162,700	85.64	Non-Traversable Median	105.64
5	Nine-lane Freeway	Urban	1338+76.705	1340+47.770	171.07	0.0324	2030: 162,700	83.00	Non-Traversable Median	103.00

Table 2. Predicted Freeway Crash Rates and Frequencies Summary (Section 1)

First Year of Analysis	**2030**
Last Year of Analysis	**2030**
Effective Length (mi)	**0.4364**
Average Future Road AADT (vpd)	**145,069**
Predicted Crashes	
Total Crashes	**19.71**
Fatal and Injury Crashes	**5.67**
Property-Damage-Only Crashes	**14.04**
Percent of Total Predicted Crashes	
Percent Fatal and Injury Crashes (%)	**29**
Percent Property-Damage-Only Crashes (%)	**71**
Predicted Crash Rate	
Crash Rate (crashes/mi/yr)	**45.1769**
FI Crash Rate (crashes/mi/yr)	**13.0059**
PDO Crash Rate (crashes/mi/yr)	**32.1711**
Predicted Travel Crash Rate	
Total Travel (million veh-mi)	**23.11**
Travel Crash Rate (crashes/million veh-mi)	**0.85**
Travel FI Crash Rate (crashes/million veh-mi)	**0.25**
Travel PDO Crash Rate (crashes/million veh-mi)	**0.61**

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present.

Note: *Total Travel and Crash Rates/Million Vehicle Miles* for *Speed Change Lanes* reflect AADTs that are **half of the Freeway Segment AADTs** based on the assumption of 50/50 directional distribution.

Table 3. Predicted Crash Frequencies and Rates by Freeway Segment/Intersection (Section 1)

Segment Number/Intersection Name/Cross Road	Start Location (Sta. ft)	End Location (Sta. ft)	Effective Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)
1	1317+43.705	1317+43.710	0.0000	0.000	0.0000	0.0000	0.0000	0.0000	0.00
2	1317+43.710	1319+57.705	0.0405	1.815	1.8149	0.5236	1.2913	44.7798	0.86
3	1319+57.705	1338+21.560	0.3530	15.583	15.5834	4.4863	11.0971	44.1453	0.84
4	1338+21.560	1338+76.705	0.0104	0.576	0.5758	0.1655	0.4103	55.1279	0.93
5	1338+76.705	1340+47.770	0.0324	1.740	1.7400	0.5001	1.2399	53.7054	0.90
Total			0.4364	19.714	19.7141	5.6754	14.0386	45.1769	0.85

Note: *Effective Length* is the *segment length* minus the length of the *speed change lanes* if present. This may create Freeway segments with zero effective length and zero crashes.

Table 4. Predicted Crash Frequencies and Rates by Horizontal Design Element (Section 1)

Title	Start Location (Sta. ft)	End Location (Sta. ft)	Length (mi)	Total Predicted Crashes for Evaluation Period	Predicted Total Crash Frequency (crashes/yr)	Predicted FI Crash Frequency (crashes/yr)	Predicted PDO Crash Frequency (crashes/yr)	Predicted Crash Rate (crashes/mi/yr)	Predicted Travel Crash Rate (crashes/million veh-mi)

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1317+43.705	1317+43.710	Information: for segment #1 (1317+43.705 to 1317+43.710), Effective median width (102.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1317+43.705	1317+43.710	Information: for segment #1 (1317+43.705 to 1317+43.710), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.705	1317+43.710	Information: for segment #1 (1317+43.705 to 1317+43.710), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.705	1317+43.710	Information: for segment #1 (1317+43.705 to 1317+43.710), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.705	1317+43.710	Information: for segment #1 (1317+43.705 to 1317+43.710), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.710	1319+57.705	Information: for segment #2 (1317+43.710 to 1319+57.705), Effective median width (103.50 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1317+43.710	1319+57.705	Information: for segment #2 (1317+43.710 to 1319+57.705), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.710	1319+57.705	Information: for segment #2 (1317+43.710 to 1319+57.705), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.710	1319+57.705	Information: for segment #2 (1317+43.710 to 1319+57.705), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1317+43.710	1319+57.705	Information: for segment #2 (1317+43.710 to 1319+57.705), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1319+57.705	1338+21.560	Information: for segment #3 (1319+57.705 to 1338+21.560), Effective median width (105.64 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1319+57.705	1338+21.560	Information: for segment #3 (1319+57.705 to 1338+21.560), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1319+57.705	1338+21.560	Information: for segment #3 (1319+57.705 to 1338+21.560), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1319+57.705	1338+21.560	Information: for segment #3 (1319+57.705 to 1338+21.560), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1319+57.705	1338+21.560	Information: for segment #3 (1319+57.705 to 1338+21.560), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+21.560	1338+76.705	Information: for segment #4 (1338+21.560 to 1338+76.705), Effective median width (105.64 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1338+21.560	1338+76.705	Information: for segment #4 (1338+21.560 to 1338+76.705), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+21.560	1338+76.705	Information: for segment #4 (1338+21.560 to 1338+76.705), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+21.560	1338+76.705	Information: for segment #4 (1338+21.560 to 1338+76.705), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+21.560	1338+76.705	Information: for segment #4 (1338+21.560 to 1338+76.705), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+76.705	1340+47.770	Information: for segment #5 (1338+76.705 to 1340+47.770), Effective median width (103.00 feet) is greater than specified boundaries (90.00 feet); adjusted in CMF calculations.
1338+76.705	1340+47.770	Information: for segment #5 (1338+76.705 to 1340+47.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+76.705	1340+47.770	Information: for segment #5 (1338+76.705 to 1340+47.770), Median barrier distance from edge of inside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+76.705	1340+47.770	Information: for segment #5 (1338+76.705 to 1340+47.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1338+76.705	1340+47.770	Information: for segment #5 (1338+76.705 to 1340+47.770), Outside barrier distance from edge of outside shoulder to barrier face (0.00 feet) is less than specified boundaries (0.75 feet); adjusted in CMF calculations.
1338+21.560	1338+76.705	Information: for segment #4 (1338+21.560 to 1338+76.705), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway
1338+76.705	1340+47.770	Information: for segment #5 (1338+76.705 to 1340+47.770), Freeway Segment of type Nine-lane Freeway is using unbalanced lane processing with types Eight-lane Freeway and Ten-lane Freeway

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Project Title: CapEx Central 2022 Alt 3 - Barrier Separated ML
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment MLNB13
Highway Comment: Imported from MLNB13.xml
Highway Version: 1

Evaluation Title: Evaluation 1
Evaluation Comment: Created Thu Jun 23 11:39:19 CDT 2022

Minimum Location: 1000+00.000
Maximum Location: 1080+39.891

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1080+39.891
Functional Class: Freeway C-D Road & System Ramp
Type of Alignment: One Direction
Model Category: C-D Road & System Ramp
Calibration Factor: CD_MV_FI=1.0; CD_MV_PDO=1.0; CD_SV_FI=1.0; CD_SV_PDO=1.0;

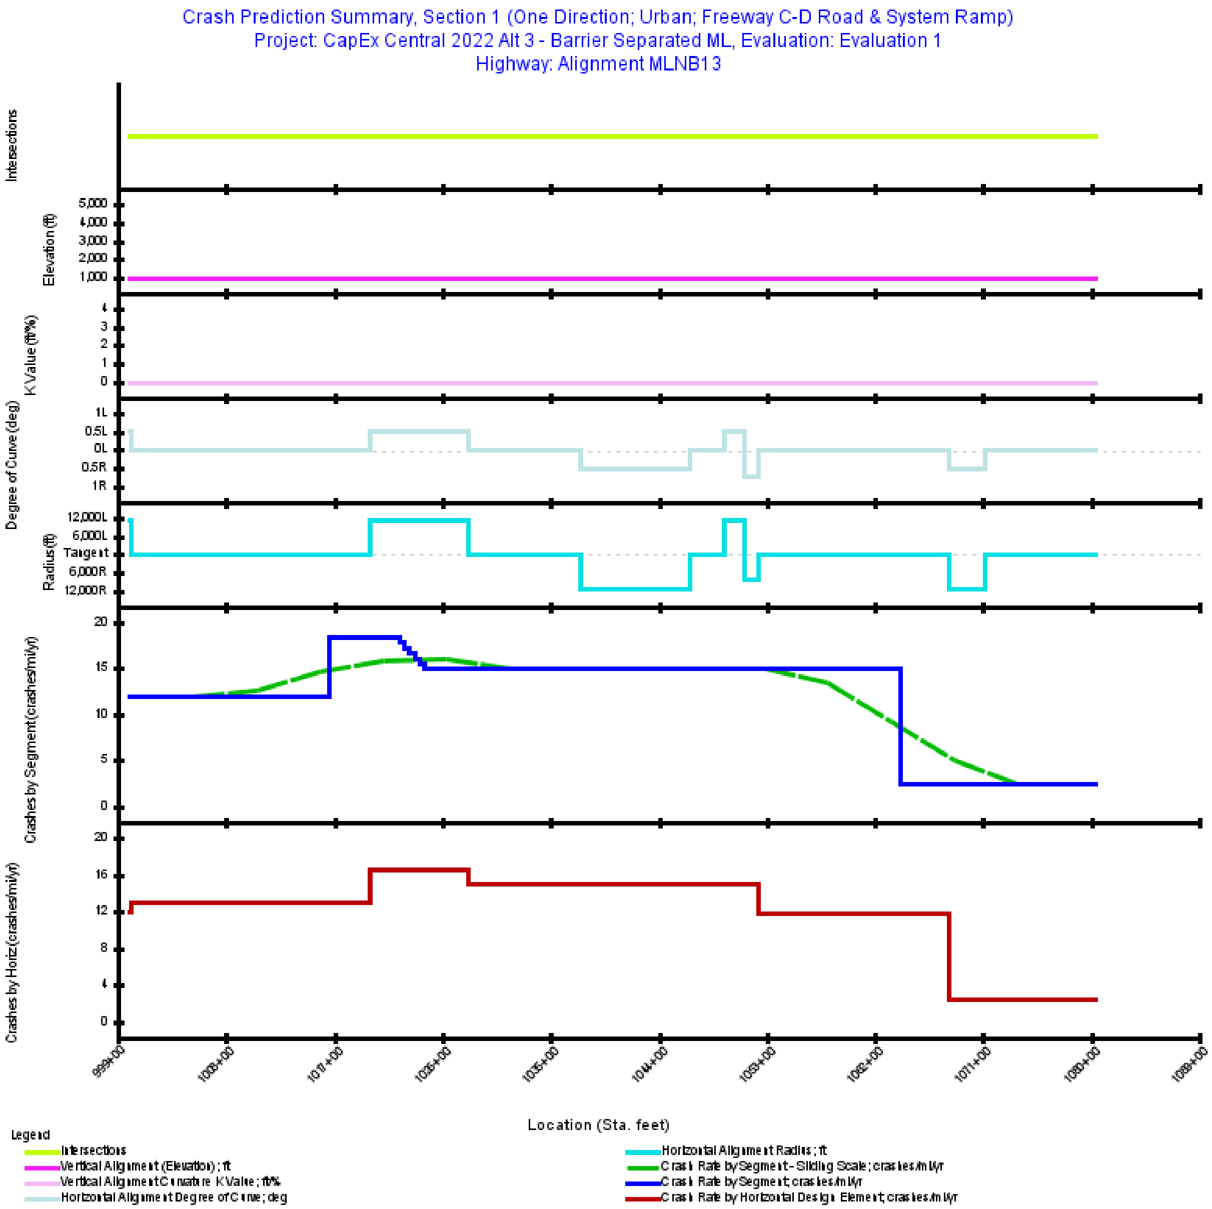

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT
1	Freeway Ramp and C-D Road Two-lane C-D Ramp	Urban	1000+00.000	1016+65.000	1,665.00	0.3153	2030: 23,100

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Maximum Location: 1082+76.220

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1082+76.220
Functional Class: Freeway C-D Road & System Ramp
Type of Alignment: One Direction
Model Category: C-D Road & System Ramp
Calibration Factor: CD_MV_FI=1.0; CD_MV_PDO=1.0; CD_SV_FI=1.0; CD_SV_PDO=1.0;

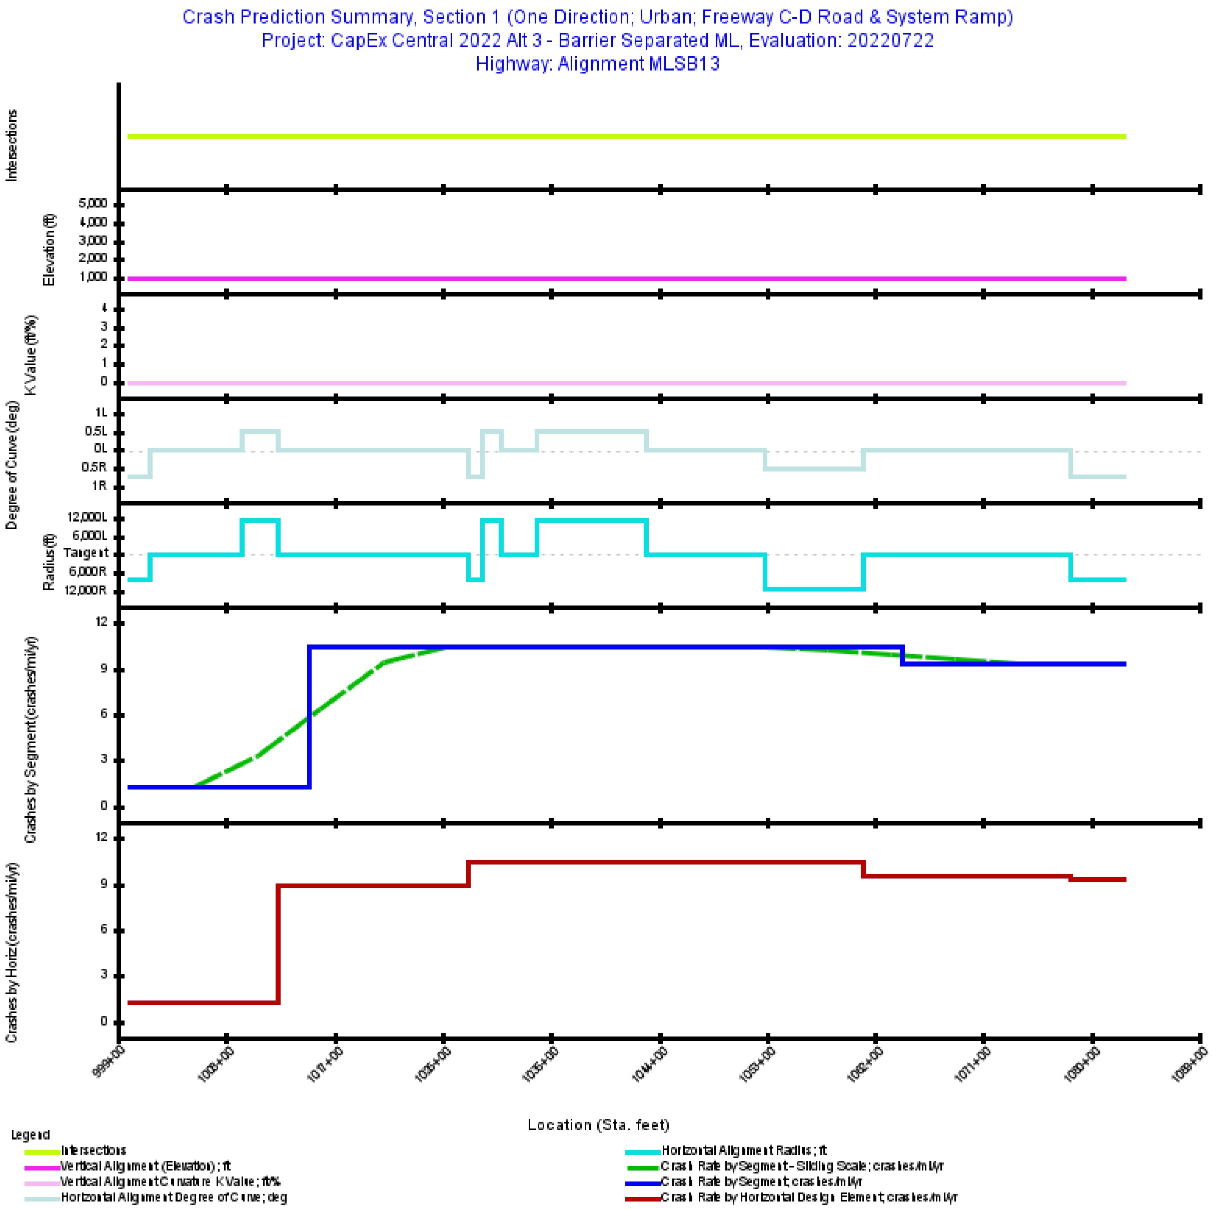

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1024+19.377
Functional Class: Freeway C-D Road & System Ramp
Type of Alignment: One Direction
Model Category: C-D Road & System Ramp
Calibration Factor: CD_MV_FI=1.0; CD_MV_PDO=1.0; CD_SV_FI=1.0; CD_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Highway Segment	Total Highway Segment Crashes	0.27	43.0	0.35	57.0	0.62	100.0
	Total Crashes	0.27	43.0	0.35	57.0	0.62	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

August 25, 2022

Disclaimer

The Interactive Highway Design Model (IHSDM) software is disseminated under the sponsorship of the Department of Transportation in the interest of information exchange. The United States Government assumes no liability for its content or use thereof. This document does not constitute a standard, specification, or regulation.

The United States Government does not endorse products or manufacturers. Trade and manufacturers' names may appear in this software and documentation only because they are considered essential to the objective of the software.

Limited Warranty and Limitations of Remedies

This software product is provided "as-is," without warranty of any kind-either expressed or implied (but not limited to the implied warranties of merchantability and fitness for a particular purpose). The FHWA do not warrant that the functions contained in the software will meet the end-user's requirements or that the operation of the software will be uninterrupted and error-free.

Under no circumstances will the FHWA be liable to the end-user for any damages or claimed lost profits, lost savings, or other incidental or consequential damages rising out of the use or inability to use the software (even if these organizations have been advised of the possibility of such damages), or for any claim by any other party.

Notice

The use of the IHSDM software is being done strictly on a voluntary basis. In exchange for provision of IHSDM, the user agrees that the Federal Highway Administration (FHWA), U.S. Department of Transportation and any other agency of the Federal Government shall not be responsible for any errors, damage or other liability that may result from any and all use of the software, including installation and testing of the software. The user further agrees to hold the FHWA and the Federal Government harmless from any resulting liability. The user agrees that this hold harmless provision shall flow to any person to whom or any entity to which the user provides the IHSDM software. It is the user's full responsibility to inform any person to whom or any entity to which it provides the IHSDM software of this hold harmless provision.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1012+01.804
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: ENT_RAMP_MV_FI=1.0; ENT_RAMP_MV_PDO=1.0; ENT_RAMP_SV_FI=1.0; ENT_RAMP_SV_PDO=1.0;

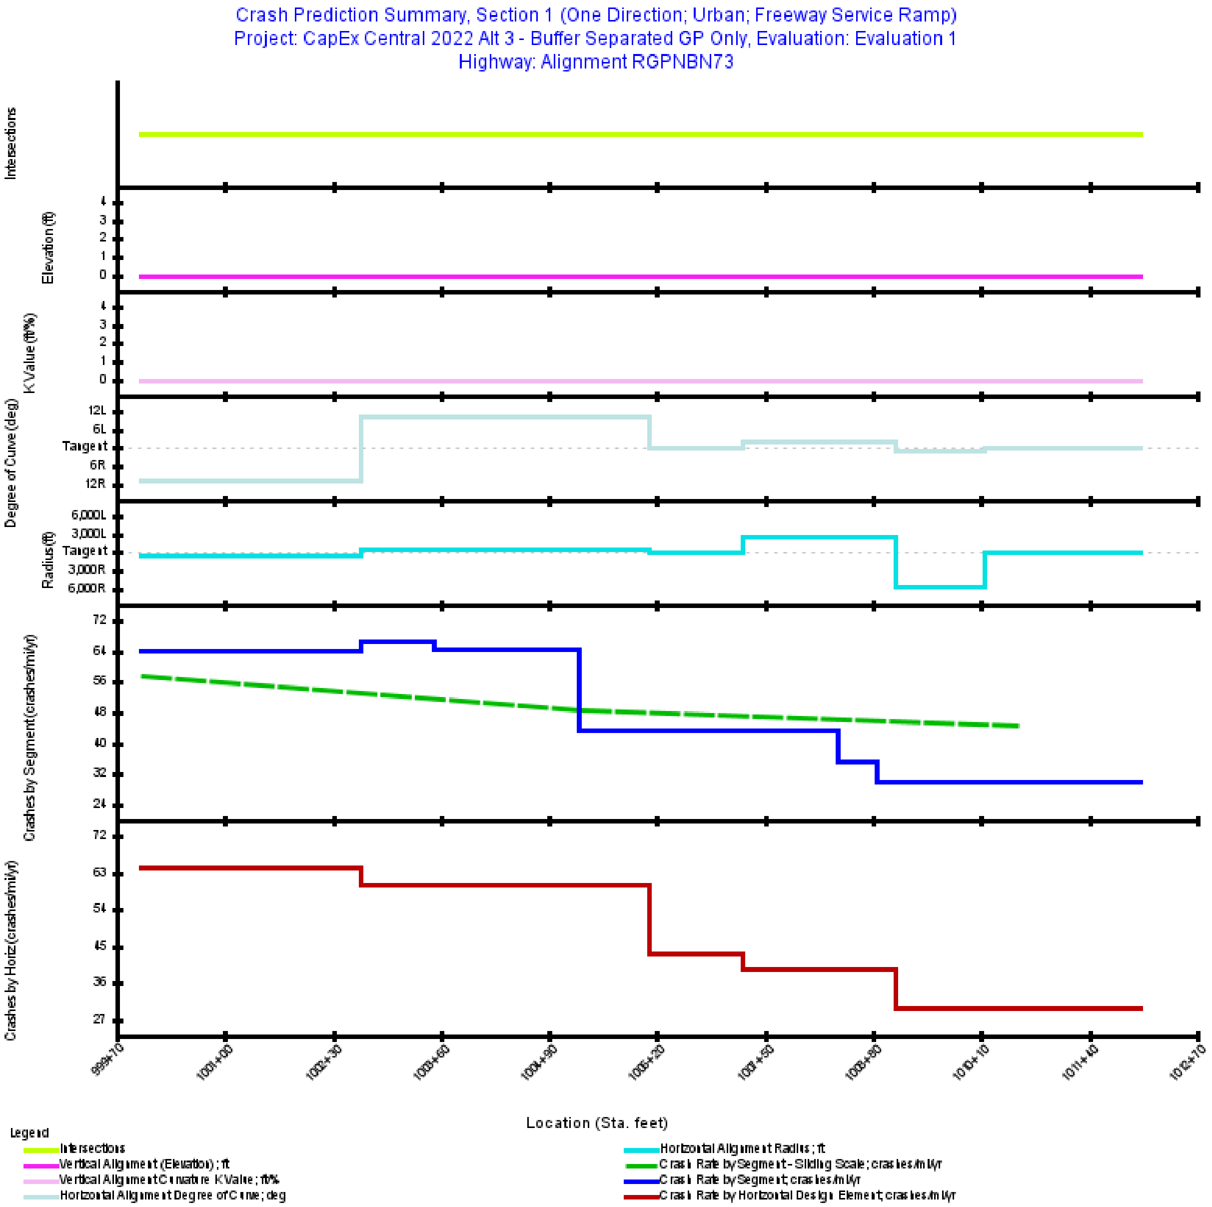

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT
1	Freeway Ramp and C-D Road Two-lane Ramp Entrance	Urban	1000+00.000	1002+63.100	263.10	0.0498	2030: 39,200
2	Freeway Ramp and C-D Road Two-lane Ramp Entrance	Urban	1002+63.100	1003+51.000	87.90	0.0166	2030: 39,200
3	Freeway Ramp and C-D Road Two-lane Ramp Entrance	Urban	1003+51.000	1005+26.000	175.00	0.0331	2030: 39,200
4	Freeway Ramp and C-D Road Two-lane Ramp Entrance	Urban	1005+26.000	1008+37.000	311.00	0.0589	2030: 39,200
5	Freeway Ramp and C-D Road Two-lane Ramp Entrance	Urban	1008+37.000	1008+85.000	48.00	0.0091	2030: 39,200

Project Title: CapEx Central 2022 Alt 3 - Buffer Separated GP Only
Project Comment: Created Fri Jun 10 15:41:42 CDT 2022
Project Unit System: U.S. Customary

Highway Title: Alignment RGPNBX153
Highway Comment: Imported from RGPNBX153.xml
Highway Version: 1

Evaluation Title: Evaluation 1
Evaluation Comment: Created Thu Jun 23 11:01:54 CDT 2022

Minimum Location: 1000+00.000
Maximum Location: 1030+56.915

Policy for Superelevation: AASHTO 2011 U.S. Customary
Calibration: HSM Configuration
Crash Distribution: HSM Configuration
Model/CMF: HSM Configuration

First Year of Analysis: 2030
Last Year of Analysis: 2030
Empirical-Bayes Analysis: None
First Year of Observed Crashes:
Last Year of Observed Crashes:

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1030+56.915
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: EX_RAMP_MV_FI=1.0; EX_RAMP_MV_PDO=1.0; EX_RAMP_SV_FI=1.0; EX_RAMP_SV_PDO=1.0;

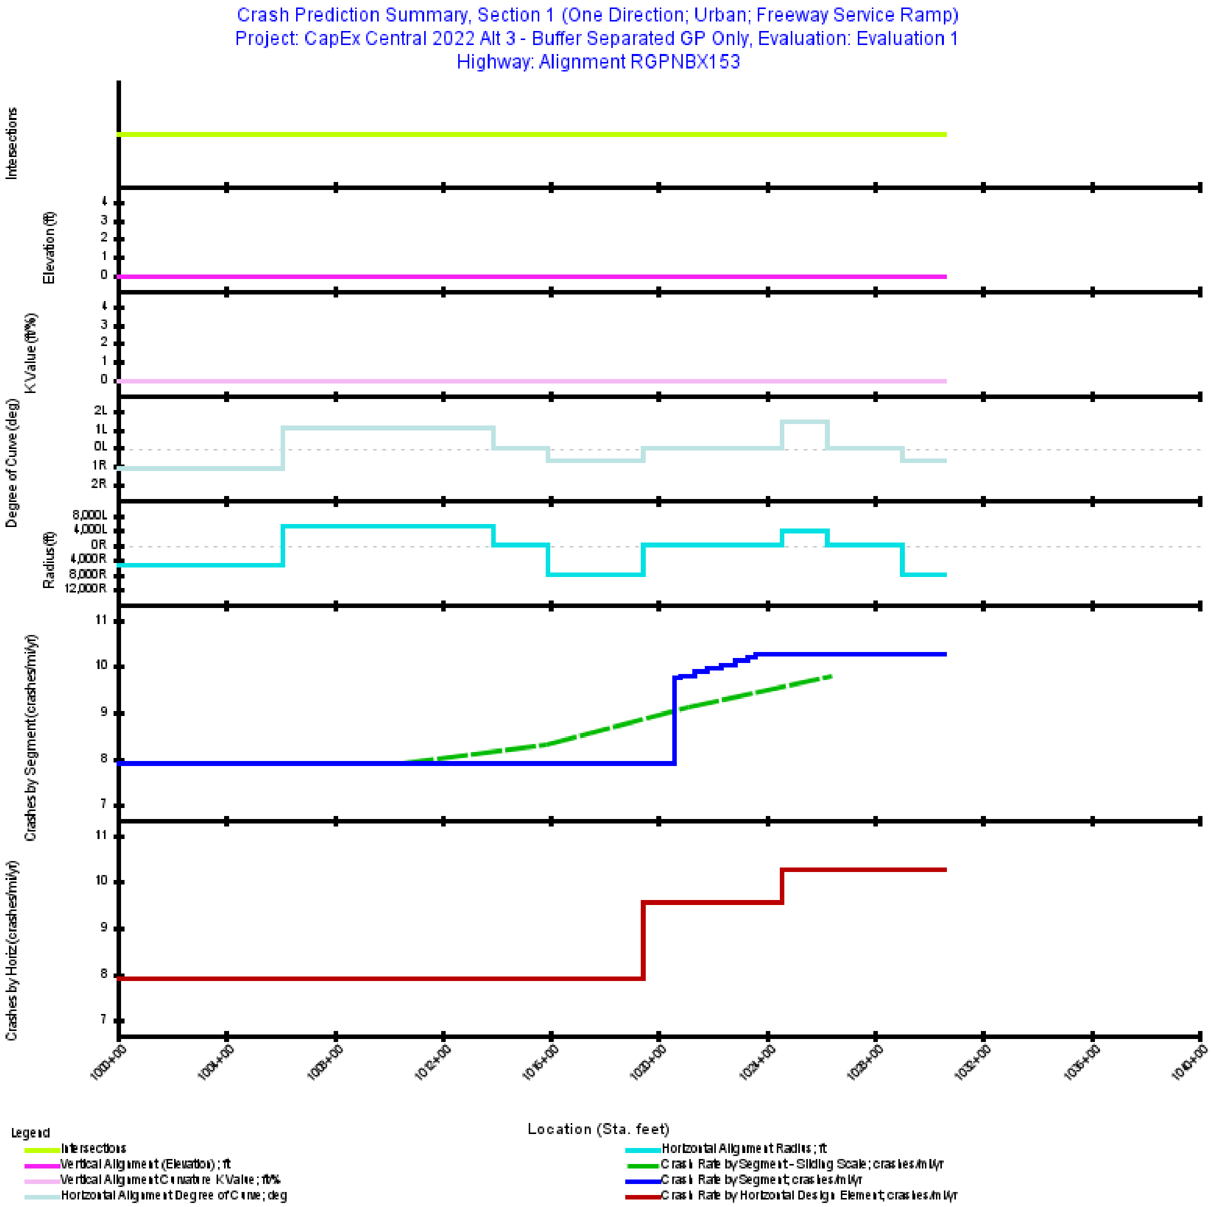

Figure 1. Crash Prediction Summary (Freeway Ramp Sections)

Table 1. Evaluation Freeway - Homogeneous Segments (Freeway Ramp Sections)

Seg. No.	Type	Area Type	Start Location (Sta. ft)	End Location (Sta. ft)	Length (ft)	Length (mi)	AADT
1	Freeway Ramp and C-D Road One-lane Ramp Exit	Urban	1000+00.000	1020+55.670	2,055.67	0.3893	2030: 23,750
2	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1020+55.670	1020+81.000	25.33	0.0048	2030: 23,750
3	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1020+81.000	1021+31.000	50.00	0.0095	2030: 23,750
4	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1021+31.000	1021+81.000	50.00	0.0095	2030: 23,750
5	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1021+81.000	1022+31.000	50.00	0.0095	2030: 23,750
6	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1022+31.000	1022+81.000	50.00	0.0095	2030: 23,750
7	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1022+81.000	1023+31.000	50.00	0.0095	2030: 23,750
8	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1023+31.000	1023+55.760	24.76	0.0047	2030: 23,750
9	Freeway Ramp and C-D Road Two-lane Ramp Exit	Urban	1023+55.760	1030+56.915	701.15	0.1328	2030: 23,750

Table 2. Predicted Ramp Crash Rates and Frequencies Summary (Freeway Ramp Sections)

First Year of Analysis	**2030**

Highway Segment	Total Highway Segment Crashes	2.21	44.1	2.80	55.9	5.01	100.0
	Total Crashes	2.21	44.1	2.80	55.9	5.01	100.0

Note: *Fatal and Injury Crashes* and *Property Damage Only Crashes* do not necessarily sum up to *Total Crashes* because the distribution of these three crashes had been derived independently.

Table 8. Evaluation Message

Start Location (Sta. ft)	End Location (Sta. ft)	Message
1000+00.000	1020+55.670	Warning: for segment #1 (1000+00.000 to 1020+55.670), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1020+55.670	1020+81.000	Warning: for segment #2 (1020+55.670 to 1020+81.000), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1020+81.000	1021+31.000	Warning: for segment #3 (1020+81.000 to 1021+31.000), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1021+31.000	1021+81.000	Warning: for segment #4 (1021+31.000 to 1021+81.000), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1021+81.000	1022+31.000	Warning: for segment #5 (1021+81.000 to 1022+31.000), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1022+31.000	1022+81.000	Warning: for segment #6 (1022+31.000 to 1022+81.000), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1022+81.000	1023+31.000	Warning: for segment #7 (1022+81.000 to 1023+31.000), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1023+31.000	1023+55.760	Warning: for segment #8 (1023+31.000 to 1023+55.760), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1023+55.760	1030+56.915	Warning: for segment #9 (1023+55.760 to 1030+56.915), The ramp type for Ramp Alignment RGPNBX153 is set at the Ramp Connection (Exit) and in the Ramp (Exit). The Ramp value takes precedence.
1000+00.000	1020+55.670	Warning: for segment #1 (1000+00.000 to 1020+55.670), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 1EX
1020+55.670	1020+81.000	Warning: for segment #2 (1020+55.670 to 1020+81.000), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX
1020+81.000	1021+31.000	Warning: for segment #3 (1020+81.000 to 1021+31.000), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX
1021+31.000	1021+81.000	Warning: for segment #4 (1021+31.000 to 1021+81.000), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX
1021+81.000	1022+31.000	Warning: for segment #5 (1021+81.000 to 1022+31.000), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX
1022+31.000	1022+81.000	Warning: for segment #6 (1022+31.000 to 1022+81.000), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX
1022+81.000	1023+31.000	Warning: for segment #7 (1022+81.000 to 1023+31.000), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX
1023+31.000	1023+55.760	Warning: for segment #8 (1023+31.000 to 1023+55.760), traffic volume (23,750 vpd) for 2030 is not within the model limit (18,000 vpd) for reliable results for segment type 2EX

Interactive Highway Safety Design Model

Crash Prediction Evaluation Report

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1003+64.250
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: ENT_RAMP_MV_FI=1.0; ENT_RAMP_MV_PDO=1.0; ENT_RAMP_SV_FI=1.0; ENT_RAMP_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Section Types

Freeway Ramp Evaluation

Section: Section 1
Evaluation Start Location: 1000+00.000
Evaluation End Location: 1008+42.869
Functional Class: Freeway Service Ramp
Type of Alignment: One Direction
Model Category: Freeway Service Ramp
Calibration Factor: EX_RAMP_MV_FI=1.0; EX_RAMP_MV_PDO=1.0; EX_RAMP_SV_FI=1.0; EX_RAMP_SV_PDO=1.0;

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

Disclaimer Regarding Crash Prediction Method

IMPORTANT NOTICE ABOUT COMPARING RESULTS FROM HIGHWAY SAFETY MANUAL FIRST EDITION (2010) MODELS TO RESULTS FROM NEW MODELS DEVELOPED UNDER NCHRP PROJECTS 17-70, 17-58, AND 17-68

Since the publication of the Highway Safety Manual - First Edition (HSM-1), in 2010 by the American Association of State Highway and Transportation Officials (AASHTO), multiple research efforts have been undertaken through the National Cooperative Highway Research Program (NCHRP) to develop safety performance models for road segment and intersection facility types that were not initially reflected in the HSM-1, in order to expand the breadth and depth of the HSM in the future.

The IHSDM Crash Prediction Module (CPM) is intended as a faithful implementation of HSM Part C predictive methods. As NCHRP projects to develop new predictive methods for the HSM are completed, FHWA works to incorporate the new methods into IHSDM, sometimes in advance of publication in the HSM. The following new crash predictive methods have been accepted by NCHRP project panels and incorporated into IHSDM, while pending AASHTO's approval for incorporation into a future edition of the HSM:

- Roundabouts: completed in 2018 under NCHRP Project 17-70, the new methods will provide improved outcomes for the safety analysis of roundabouts.
- 6+ lane and one-way urban/suburban arterials (including models for segments and intersections): completed under NCHRP Project 17-58.
- Intersection crash prediction methods for some intersection configurations and traffic control types not currently addressed in the HSM (e.g., all-way stop; rural 3-leg signalized; 3-leg stop-controlled where the major leg turns; urban 5-leg signalized; urban high-speed intersections): completed in 2021 under NCHRP Project 17-68.

However, in the absence of local calibration factors (see HSM-1 Part C, Appendix A for guidance on calibration of the predictive models), it is neither appropriate nor advisable to directly compare the results from new models (from NCHRP Projects 17-58, 17-68, and 17-70) to results from HSM-1 models, as the models were not calibrated to the same base state data sets, and consequently can produce unexpected results. If local calibration factors are available and applied to both new models and HSM-1 models, then it may be appropriate to directly compare the results.*[Note: Work being performed under NCHRP Project 17-72 (Update of Crash Modification Factors for the Highway Safety Manual) is expected to re-calibrate many of the old (HSM-1) and new (e.g., NCHRP 17-70) models to data from a single (or small number of) states, that would allow results from all models to be directly compared.]*

The models produced for NCHRP Project 17-70 have independent value in terms of informing the design of a roundabout and assessing the effects of different design characteristics on the expected safety performance of a roundabout.

The HSM-1 interim method previously included in IHSDM for evaluating roundabouts on urban/suburban arterials (i.e., evaluating an existing intersection and then applying a Crash Modification Factor for replacing the existing intersection with a roundabout) has been deactivated in IHSDM, to minimize any confusion with the new roundabout methodology.

MEMO

January 13, 2021

To: Susan Fraser, P.E., CFM

From: Matthew G. Best, P.E., PTOE
HDR

Subject: I-35 Capital Express Central Project: No-Build Projected 2025 and 2045 Travel Times between US 290E to US290W/SH 71

Introduction

As part of the I-35 Capital Express Central Project's Purpose and Need, corridor mainlane travel time projections for future years 2025 and 2045 were developed. The purpose of this memo is to outline the methodology used to forecast the 2025 and 2045 corridor travel times.

Methodology

The calibrated 2017 I-35 AM and PM peak hour *Vissim* microsimulation models were incorporated in the analysis. The models include the general purpose mainlanes, ramps, interchanges, and frontage roads. Using the calibrated existing 2017 conditions models as bases, the No-Build scenario AM and PM peak hour *Vissim* models were constructed for the future years of 2030 and 2050. In the future year models, traffic volumes were increased, assuming a two (2) percent annual growth rate between 2017 and 2030 and a 1.5 percent annual growth rate between 2030 and 2050. The 2030 and 2050 AM and PM peak model geometries were also revised to reflect projects previously planned by TxDOT for construction that would be completed by 2030, including the following projects within the I-35 Capital Express Central limits:

- I-35 at Oltorf Street
- I-35 at 51st Street

The 2030 and 2050 No-Build *Vissim* models' traffic volumes were adjusted to 2025 and 2045 to align with the Purpose and Need and the 2045 Regional Transportation Plan. In these adjusted models, the traffic volumes were decreased, assuming a two (2) percent annual growth reduction between 2030 and 2025 and a 1.5 percent annual growth reduction between 2050 and 2045. The models were run multiple times with different random seeds, and the travel times were summarized to determine the projected travel times to traverse the limits of the I-35 Capital Express Central project.

Results

Table 1 shows the 2019 field travel times (based on INRIX data) and the projected Central corridor No-Build mainlane travel times for 2025 and 2045 between US 290E and US 290W/SH 71. The future year No-Build model results show significant increases in travel times in the study area due to excessive congestion, most noticeably in the PM peak period results.

Table 1: 2019 Existing and Future Years No-Build Projected Corridor Mainlane Travel Times between US 290E and US 290W/SH 71

	2019 (INRIX)		2025		2045	
Direction	AM Peak Hour (min)	PM Peak Hour (min)	AM Peak Hour (min)	PM Peak Hour (min)	AM Peak Hour (min)	PM Peak Hour (min)
NB	19.2	32.2	19.8	131.6	33.6	223.2
SB	16.6	36.6	16.4	78.3	19.5	208.6

Subject: CapEx Central Travel Demand Model Update and Measures of Effectiveness Summary

---

As the Build Alternatives of Interstate 35 Capital Express Central project in Austin, Texas are being reviewed for the project Environmental Impact Analysis process, the project environmental team has identified a list of evaluation criteria comparing No Build and Build Alternatives (Alternative 2 and Modified Alternative 3). Within the Purpose and Need section of the evaluation criteria matrix, one of the subsections "Addressing demand by prioritizing the movement of people, goods, and services through and across the corridor; improving operational efficiency" contain four criteria of "Mainlane Travel Times", "Managed Lane Travel Time", "Travel demand along adjacent transportation roadway network", and "Annual cost of travel."

To address the latter two mentioned criteria, the GEC was tasked with updating the 2045 CAMPO Travel Demand Model (TDM) for the Central segment based on the provided schematics for each alternative. The outcomes of these TDM model runs were utilized in generating the requested Measures of Effectiveness (MOE) of daily vehicle-miles-of-travel (VMT) and vehicle-hours-of-travel (VHT) by roadway type. The area of analysis includes a 1-mile buffer around I-35, MoPac, and US 183, as shown in

Figure *1*.

The GEC provided the MOEs for the following alternatives:

- No-Build (Model files received from Alliance Transportation Group [ATG] and no further updates were incorporated)
- Alternative 2 (Updated based on pencil-down schematics received on 05/24/2022)
- Modified Alternative 3 (Updated based on pencil-down schematics received on 05/24/2022)

The updates entailed modifications to roadway link geometries, link direction, number of lanes, functional class, and area type to match the corresponding schematics. The MOE summary for these three alternatives is presented in Table *1*. VMT is the total distance traveled by all the vehicles in the network within the buffers and VHT is the total travel time of all vehicles on the roadway links within the buffers. The sum of daily VMT of I-35 (excluding mainlanes, HOV lanes, ramps, frontage roads, and collector-distributor roads), MoPac (full buffer), and US 183 (full buffer) was utilized for the criterion “Travel demand along adjacent transportation roadway network”.

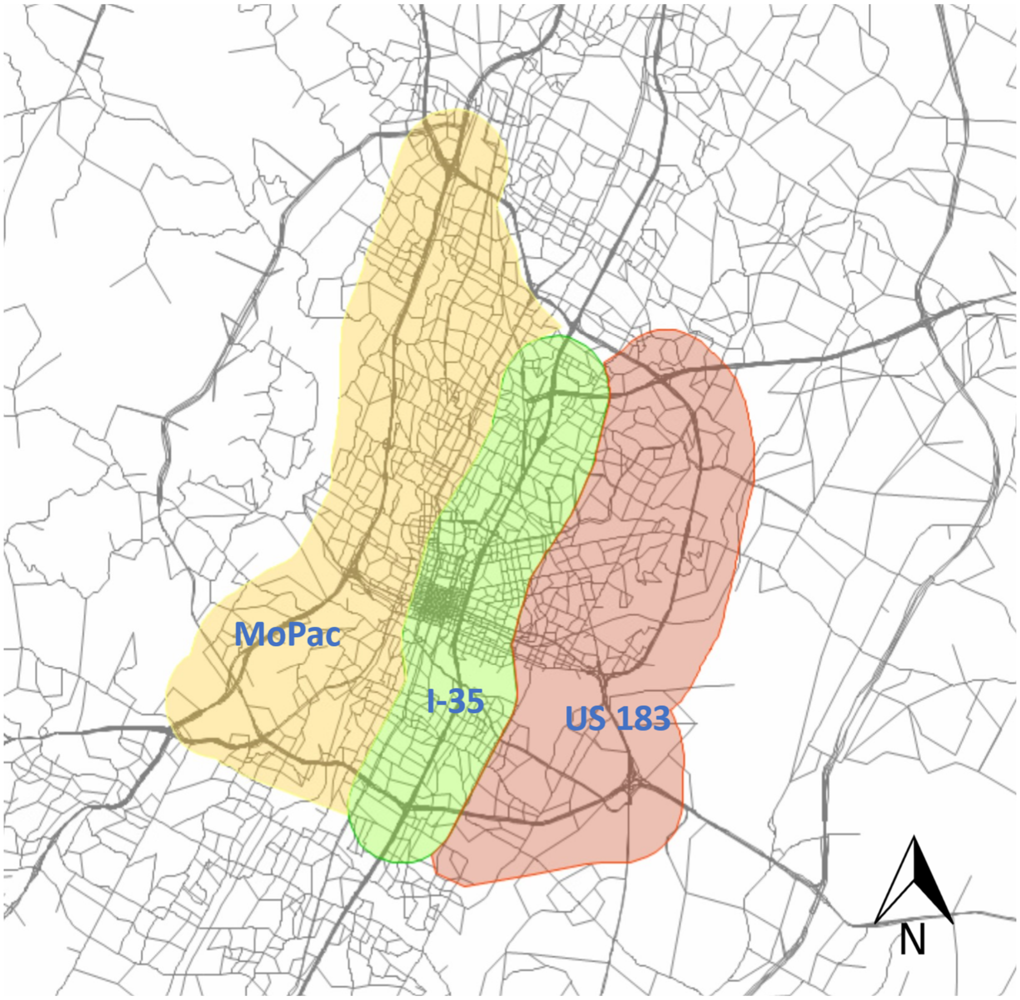

Figure 1. MOE Buffer Map

Table 1. MOE Summary (Year 2045)

Buffer	I-35		MoPac	US 183	Total
Roadway Types	Main & HOV	Others (Excluding frontage road, ramps, CDs and DCs)	All		Others/All
MOE	Daily VHT	Daily VMT	Daily VMT		Daily VMT
Alt 2	65,028	2,580,673	7,466,499	4,341,464	14,388,636
Modified Alt 3	68,065	2,576,748	7,451,638	4,313,764	14,342,150
No-Build	73,882	2,583,970	7,542,305	4,474,545	14,600,820

For the “annual cost of travel” criterion, the daily I-35 (mainlanes and HOV lanes) VHT values were converted to monetary values to estimate travel costs. These VHTs were assumed to be realized on 250 days per year (approximate number of annual workdays) at an hourly cost of $32.83, which is based on passenger car value of delay time, as determined by The University of Texas at Austin Center for Transportation Research (“Value of Delay Time and Road User Costs”, Memorandum from Duane S. Milligan, P.E. and Marisabel Z. Ramthun P.E., March 10, 2022). The resulting values are shown in Table 2.

Table 2. I-35 Mainlane & HOV Lane Annual Cost of Travel

Buffer	I-35	
MOE	Daily VHT	Annual Cost of Travel (2045)
Alt 2	65,028	$534M
Modified Alt 3	68,065	$559M
No-Build	73,882	$606M

Historical Crash Memo

MEMO

September 8, 2022

To: Tommy Abrego, P.E.
Mobility35 Program Manager, TxDOT Austin District

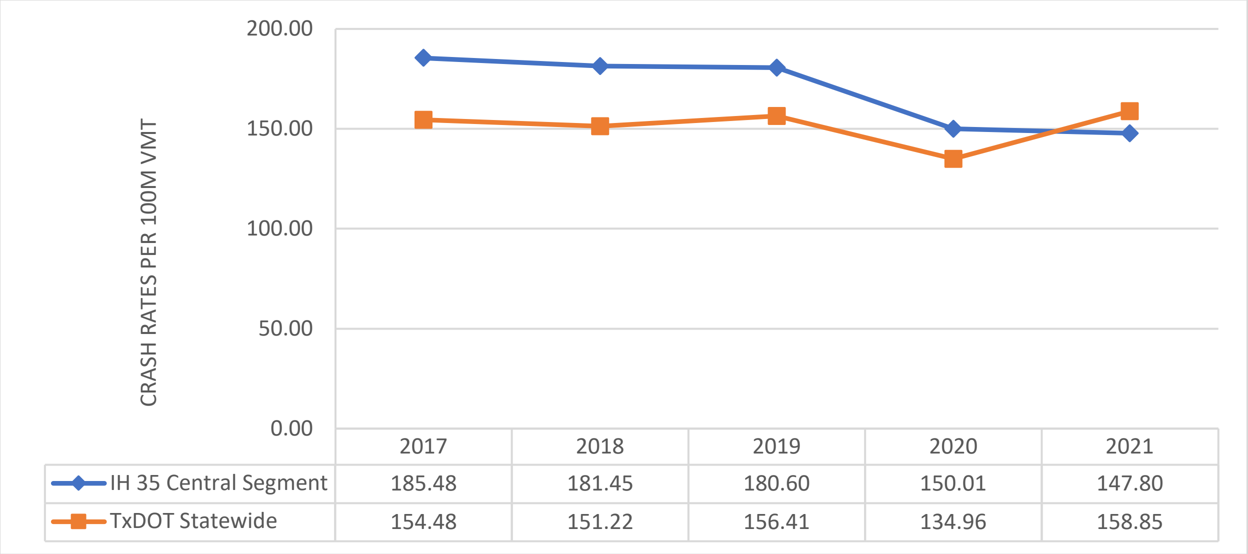
From: Matthew G. Best, P.E., PTOE
Traffic Project Manager, HDR

Subject: Mobility35 Capital Express Central: Historical Crash Analysis

---

As part of the Interstate 35 Capital Express Central project in Austin, Texas, an Environmental Impact Statement (EIS) is being prepared. As part of the Purpose and Need section of the EIS, safety deficiencies have been identified as part of the need for improvements along the corridor. This memorandum documents the recent historical crash history of the project area.

To analyze safety within the project limits, crash data from years 2017 through 2021 were obtained from TxDOT Design Division. A total of 5,190 crashes were reported during the five-year period, with 57 percent of the crashes occurring on the mainlanes, 38 percent on the frontage roads, and the remaining 5 percent on the ramps and connectors of the system. **Figure 1** shows the crash rates within the project limits compared to the statewide average for urban interstate facilities in Texas. Over this five-year period, the project limits had an average crash rate of 169.07 crashes per 100 million VMT, and, for every year, crash rates were higher than the statewide average except in 2021.



Sources TxDOT Statewide Traffic Crash Rates 2017, 2018, 2019, 2020, and 2021

Figure 1. Capital Express Central Crash Rates per 100M VMT

Table 1 shows the total number of crashes along with crash severity data within the project limits using the KABCO injury scale, which categorizes injuries by level of severity. Years 2020 and 2021 had significantly fewer crashes compared to the previous three (3) years as the project limits, like the rest of the state, had significantly less traffic volume due to the COVID-19 pandemic. Of the 5,190 total crashes, there were 37 (0.7 percent) fatal crashes (K), 142 (2.7 percent) incapacitating injury crashes (A), 1,058 (20.4 percent) non-incapacitating injury crashes (B), 1,162 (22.4 percent) possible injury crashes (C), and 2,703 (52.1 percent) property damage only (PDO) crashes (O). An additional 88 (1.7 percent) of the crashes were reported with no severity.

Table 1. Capital Express Central Crash Severity Summary

Year	Fatal Crashes (K*)	Severe Incapacitating Crashes (A*)	Moderate Non-Incapacitating Crashes (B*)	Minor Possible Injury Crashes (C*)	Property Damage Only Crashes (O*)	Unknown Severity Crashes	Total Crashes
2017	3	29	217	245	657	18	1,169
2018	9	36	208	266	618	11	1,148
2019	10	23	250	276	561	14	1,134
2020	2	24	195	156	415	17	809
2021	13	30	188	219	452	28	930
Avg/Yr	7	28	212	232	541	18	1,038
Totals	37	142	1,058	1,162	2,703	88	5,190
%	0.7%	2.7%	20.4%	22.4%	52.1%	1.7%	

Source: TxDOT, FHWA

*KABCO Injury Scale = “K” – Fatal injuries including deaths that occur within 30 days following an injury in a motor vehicle crash. “A” – Severe injuries including skull fractures, internal injuries, broken or distorted limbs, unconsciousness, severe lacerations, severe burns, and unable to leave the scene without assistance. “B” – Moderate injuries including viable injuries such as a “lump” on the head, abrasions, and minor lacerations. “C” – Minor injuries including hysteria, nausea, momentary unconsciousness, and complaint of pain without visible signs of injury. “O” – Property damage only.

Table 2 shows crash type, including bicycle and pedestrian accidents. The data indicate that of the 5,190 total recorded crashes within the project limits, there were:

- 1,674 (32.2 percent) rear-end crashes
- 1,291 (24.9 percent) same direction crashes other (not sideswipes or rear ends)
- 785 (15.1 percent) angle/other crashes
- 653 (12.6 percent) single vehicle fixed object/overturn/turning
- 599 (11.5 percent) sideswipe crashes
- 97 (1.9 percent) single vehicle pedestrian/bicycle crashes
- 91 (1.8 percent) opposite direction crashes

Of the 97 crashes involving a pedestrian or cyclist, 38 (39 percent) of them occurred between 8th Street and Cesar Chavez Street. Twenty-five of these 38 crashes within this section of the project limits occurred at intersections.

Table 2. Capital Express Central Crash Type Summary

Year	Single Vehicle (Fixed Object/ Overturn/Turning)	Single Vehicle (Pedestrian/ Bicycle)	2+ Same Direction (Sideswipe)	2+ Same Direction (Rear End)	2+ Same Direction (Other)	2+ Opposite Direction	2+ Angle/ Other	Total
2017	124	12	133	374	341	17	168	1,169
2018	142	19	116	387	315	25	144	1,148
2019	113	36	127	413	269	23	153	1,134
2020	120	11	109	235	166	13	155	809
2021	154	19	114	265	200	13	165	930
Avg/Yr	131	19	120	335	258	18	157	1,038
Totals	653	97	599	1,674	1,291	91	785	5,190
%	12.6%	1.9%	11.5%	32.2%	24.9%	1.8%	15.1%	

Source: TxDOT

Additionally, two (2) fatal crashes in which the contributing factor was “pedestrian failed to yield right-of-way to vehicle” occurred on the 4th Street Lance Armstrong Bikeway—both between 4:00 a.m. and 6:00 a.m. Five (5) injury crashes with the same contributing factor (three (3) Injury B and two (2) Injury C), occurred within 350 feet of the 7th Street interchange. All of these five (5) crashes occurred during the morning and afternoon peak hours. Even though there are crosswalks at the intersections of the I-35 frontage roads and 6th, 7th, and 8th Streets, these crashes resulted because pedestrians crossed the frontage roads/side streets midblock.

MEMO

September 8, 2022

To: Tommy Abrego, P.E.
TxDOT Austin District

From: Matthew G. Best, P.E., PTOE
Engineer Traffic, HDR

Subject: Mobility35 Capital Express Central: Build Alternative Options

Background

Interstate 35 (I-35) is being reconfigured to accommodate the future managed lanes and other improvements in Travis County. The Texas Department of Transportation (TxDOT) has identified approximately 27 miles of I-35, extending from SH 45 North (SH 45 N) to SH 45 Southeast (SH 45 SE) in Travis County, that will be reconstructed and/or have additional capacity added to meet the significant growth that has occurred in the Austin area.

Study Area

The Mobility35 Capital Express project study area consists of the I-35 segment between SH 45 N and SH 45 SE, divided into three segments, as shown in Figure 1:

- South: From SH 45 SE to US 290 W/SH 71
- Central From US 290 W/SH 71 to US 290 E
- North: From US 290 E to SH 45 N

The South and North segments were each analyzed as part of previous projects, while the Central project is the subject of the current analysis and this memorandum.

Traffic Volume Forecasting

Existing (2019) traffic volumes were used to develop traffic forecasts for the Central Segment for the following future year scenarios:

- Opening Year 2030
- Design Year 2050

An annual growth rate of 1.5 percent was recommended to be utilized to project the Opening Year 2030 traffic volumes (2016 – 2030) and to project the Design Year 2050 volumes (2016 – 2050), and 1.0 percent was recommended to be utilized to project the Horizon Year (2050+) volumes along the I-35 Central section (SH 71 to US 290 E) for this study. The recommended annual growth rates translate to an approximate increase of 15 percent traffic volumes between 2019 and 2030 and 45 percent between 2019 and 2050 for the Central segment.

Vissim Modeling

The study corridor for this analysis was simulated using the *Vissim* software (version 11.00). *Vissim* is a microscopic traffic simulation software that models vehicles and other components as individual units and updates them every time step (usually multiple times per simulation second). After defining the street geometry, traffic control (e.g., stop signs, signals), and vehicular volumes, *Vissim* outputs measures of effectiveness (e.g., average delay, queue lengths, speeds) that can then be used as a basis for comparison of alternatives. *Vissim* also has the capability of modeling various modes of transit, such as bus and rail.

Existing (2019) AM peak and PM peak period traffic conditions along the I-35 corridor were first modeled to provide base condition models. Future year (2030 and 2050) No Build condition models were then constructed and used as points of comparison for the Build alternative models. The Central No Build Alternative *Vissim* model incorporates the Build improvements of the North and South Build Capital Express project schematics.

The I-35 Capital Express Central project has identified potential schematic improvements in the area of US 290 E to US 290 W/SH 71 to improve mobility throughout the project. Using the Central No Build Alternative *Vissim* model (incorporating mainlanes, high-occupancy vehicle (HOV) managed lanes, ramps, interchanges, frontage roads, and select cross streets between St Johns Avenue and Stassney Lane, as shown in Figure 2) and 2030/2050 peak volumes, HDR coded two Build alternatives to determine traffic operational impacts compared to No Build. The three alternatives analyzed are:

1. No Build Alternative
2. Build Alternative 2
3. Modified Build Alternative 3

Results

Table 1 provides a comparison of network-wide average delay per vehicle between the No Build Alternative and the two Build Alternatives for the AM and PM peak hours. The average delay per vehicle metric is the total delay on mainlanes, HOV managed lanes, frontage roads, ramps, and cross streets (including latent delay) divided by all vehicles present at any point during the simulation analysis period (including latent demand).

Table 1: Average Delay per Vehicle (Sec)

Peak Period	No Build	Build Alternative	
		2	3 MOD
AM	414.0	174.1	167.4
% change compared to No Build		-58%	-60%
PM	708.2	428.8	465.5
% change compared to No Build		-39%	-34%

Table 2 provides a comparison of corridor travel times (between US 290 E and US 290 W/SH 71) among the alternatives during the PM peak hour, which is the most congested time period during a typical weekday. For the EIS, mainlane (general purpose) and HOV managed lane travel times were obtained within the Central study area for the 2030 p.m. peak hour for all three alternatives.

Table 2: Corridor Travel Time Comparison

Alternative		Northbound (SH 71 to US 290 East)		Southbound (US 290 East to SH 71)		Average Northbound/Southbound	
		Travel Time (min)	%	Travel Time (min)	%	Travel Time (min)	%
No Build	GP	19.8	-	20.0	-	19.9	-
2	GP	8.6	-57%	8.4	-58%	8.5	-57%
	HOV	8.2	-	9.3	-	8.8	-
Modified 3	GP	8.5	-57%	8.8	-56%	8.6	-57%
	HOV	7.8	-	9.6	-	8.7	-
