1.0 Introduction

The Texas Department of Transportation (TxDOT) Austin District is proposing improvements to Interstate Highway 35 (I-35) from US Highway 290 East (US 290E) to State Highway 71 (SH 71)/Ben White Boulevard (CSJ: 0015-13-388). See **Appendix A** for a Project Location Map.

Modeled Scenarios

For the carbon monoxide (CO) analysis, both the No Build Alternative and the Modified Alternative 3 (Mod Alt 3) were modeled for the estimated time of completion (ETC) year (2032) and design year (2050), in accordance with TxDOT's *Environmental Guide: Volume 2 Activity Instructions (March 2023).*

2.0 Background Information

CO is a primary pollutant from motor vehicles that is largely emitted from a vehicle's exhaust system; thus, there is a federal requirement to model localized CO concentrations for proposed highway projects. Projects that are adding capacity may result in an increase of CO emissions; therefore, TxDOT requires the completion of a project-level CO analysis for added capacity projects that exceed an annual average daily traffic (AADT) volume of 140,000 vehicles per day (vpd).

Since the project would add capacity and the design year traffic volume is above 140,000 vpd (see **Table 1** below), a CO traffic air quality analysis (TAQA) is required to assess whether the project would adversely affect local air quality by contributing to CO levels that exceed the 1-hour or 8-hour CO National Ambient Air Quality Standard (NAAQS).

3.0 Analysis Methodology

The CAL3QHC dispersion model was used to calculate CO concentrations for the modeled scenarios. The supplied traffic data includes 24-hour AADT volumes for the years of 2030 and 2050 (see **Table 1** below). See **Appendix B** for the complete traffic data provided by TxDOT Austin District.

Table 1: Projected AADT and DHV

I-35 Sections: Mainlanes	*AADT*		*DHV*	
	2030	2050	2030	2050
Section 1: William Cannon Dr. to MLK Blvd.	203,000	251,450	12,180	15,087
Section 2: MLK Blvd. to St. Johns Ave	234,700	293,200	14,082	17,592
I-35 Sections: Frontage Roads	***AADT***		***DHV***	
	2030	**2050**	**2030**	**2050**
Section 2: Ben White Blvd/SH 71 to Oltorf Street	48,600	59,250	2,916	3,555
Section 3: Oltorf Street to MLK Blvd	113,700	143,450	6,822	8,607
Section 4: MLK Blvd to 38 1/2th Street	47,300	60,750	2,838	3,645
Section 5: 38 1/2th Street to US 290	132,050	166,000	7,923	9,960
Section 6: US 290 to St. Johns Ave	74,050	91,600	4,443	5,496

DHV – Design Hourly Volume

A growth rate per traffic section was applied to the 2030 traffic volumes to utilize volumes for the ETC year of 2032 in the CO analysis.

The CO analysis includes modeled free-flow areas, as well as select intersections. The free-flow segments (segments 1 through 4) modeled in the CO analysis were chosen based on the areas of the project with the highest AADT and narrowest ROW. Each of the segments were modeled for both alternatives in both the ETC and design year. See **Appendix C** for the mapped modeled segment locations. The modeled segment limits and their respective traffic sections are as follows:

- Segment 1: South of 51st St to N of Airport Blvd (within Traffic Section 2 (Mainlanes) and Section 5 (Frontage Roads)
- Segment 2: North of Dean Keeton to Manor Rd (within Traffic Section 2 (Mainlanes) and Section 4 (Frontage Roads)
- Segment 3: Holly St to north of Lake Austin Dr (within Traffic Section 1 (Mainlanes) and Section 3 (Frontage Roads)
- Segment 4: Woodward St to south of Oltorf St (within Traffic Section 1 (Mainlanes) and Section 2 (Frontage Roads)

Intersection segments (segments 5 through 6) were modeled and chosen based on their Level of Service (LOS) rating (either D, E, or F, with F being the worst LOS). LOS for all the intersections within the Mod Alt 3 area were identified for the ETC and design year, as well as AM and PM peak periods. From this, the two intersections with the most prevalent "F" rated LOS across the peak periods and analyzed years were chosen as the segments for this CO analysis.

- Segment 5: 7th St Intersection (within Traffic Section 1 (Mainlanes) and Section 3 (Frontage Roads).
- Segment 6: Riverside Dr Intersection (within Traffic Section 1 (Mainlanes) and Section 3 (Frontage Roads)

Background CO concentrations of 1.6 parts per million (ppm) (1-hour) and 1.3 ppm (8-hour) were used for the model in accordance with Appendix B of TxDOT's *Environmental Guide: Volume 2 Activity Instructions (March 2023)*.

Variable emission rates were used in the analysis based on worst-case peak speeds. Worst-case peak traffic speeds range from 3 to 67 mph for both free-flow and intersection scenarios. The rates were derived from the MOVES3 model, gathered from the TxDOT CO TAQA Running and Idling Emission Rates Lookup Tables (ERLT) for TAQA (*TxDOT Air Quality Toolkit, January 2023*).

The following adverse meteorological conditions are the worst-case assumptions and input parameters used in the analysis, in accordance with Appendix D of TxDOT's *Environmental Guide: Volume 2 Activity Instructions (March 2023):*

- Averaging time of 60 minutes
- Atmospheric Stability Class of 4 (stable)
- Mixing height of 1,000 meters
- Wind speed of 1 meter per second
- Winds blowing parallel to the roadway
- Surface roughness coefficient of 108 cm
- Source height ranging from -32 feet to +25 feet
- Background CO Concentration for Austin: 1.6 and 1.3 ppm (1-Hour and 8-Hour, respectively)

The following input parameters were used in the intersection analysis, in accordance with *User's Guide to CAL3QHC Version 2.0: A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections (Revised):*

- Average total signal cycle length
- Average red total signal cycle length
- Clearance lost time
- Approach volume on queue link
- Idle emission factor
- Saturation flow rate
- Signal type
- Arrival rate

4.0 Receptor Locations

Free-flow receptors were modeled on the future ROW line for each modeled segment. Intersection receptors were modeled at least 10 feet away from the nearest travel lane and on public use features, such as a sidewalk, and placed at each quadrant of the intersection. A standard height of 5.9 feet was given to the receptors for all models to simulate the average height of a person. **Table 2** and **Table 3** depict the associated ROW, LOS, and traffic at each of the modeled receptors. Aerial maps depicting the receptor locations along the project ROW are found in **Appendix C**.

Table 2: Free-flow Receptor Descriptions

Name	Segment	Distance from Roadway	ROW Width	2032 Total DHV	2050 Total DHV	2032 Total AADT	2050 Total AADT	Traffic Speeds
Receptor 1 (R1)	Segment 1	103 ft	487 ft	22,502	27,552	375,041	459,200	3-56 mph
Receptor 2 (R2)	Segment 1	85 ft	487 ft	22,502	27,552	375,041	459,200	3-56 mph

Riverside Dr (RS SW)	Segment 6	10 ft	F	19,423	23,694	323,726	394,900	3-44 mph
Riverside Dr (RS NW)	Segment 6	8 ft	F	19,423	23,694	323,726	394,900	3-44 mph

5.0 Analysis Results

The 1-hour CO NAAQS is 35 ppm, while the 8-hour NAAQS is 9 ppm, which are not to be exceeded more than once in a year. Modeling results indicate that local concentrations of CO are not expected to exceed national standards at any time along any segment of the project. While emission rates are expected to decrease over time, some model results show a slight increase in CO concentrations from 2032 to 2050. These increases can be explained with the worsening traffic speeds predicted for 2050.

The highest CO concentration result and percent of the 1-hour and 8-hour NAAQS along the I-35 project for all scenarios and intersections are recorded in **Tables 4 through 7**. The highest modeled CO concentrations mostly occur in Segment 2, from north of Dean Keaton to Manor Road, and represents the worst-case results for the project. Even though the AADT for Segment 2 isn't the highest, it has the lowest peak period speeds and narrowest ROW by 145 feet with the associated receptors being in close proximity to frontage roads with high emission rates. Segment 3 CO concentrations see similar results to a lesser degree than Segment 2 for the same reason. In contrast, the lowest modeled CO concentrations occur in Segments 1 and 4, which have wider ROW.

The projected CO concentrations are relatively consistent between the 7th St and Riverside intersections, with the highest CO concentration result occurring at 7th Street in the Mod Alt 3 2050 scenario. Both intersections fall within traffic sections Mainlane Section 1 and Frontage Road Section 3, meaning that roadway design and speeds are the primary deciding factors in their CO concentrations.

Among all modeled segments, receptor proximity to roadway section tends to be a standout determining factor for CO concentrations. Peak speed limit is a key contributing factor for any variance in expected CO concentrations between ETC and Design scenarios since they vary with year while AADT between the scenarios grow in tandem.

The associated input and output CAL3QHC files have been submitted with this technical report for inclusion in the project files.

Quantitative MSAT Analysis Technical Report – Preferred Alternative

Quantitative Mobile Source Air Toxics Analysis

I-35 Capital Express Central Project

Travis County, Texas
Austin District
CSJ: 0015-13-388

August 2023

The environmental review, consultation, and other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by TxDOT pursuant to 23 U.S.C. 327 and a Memorandum of Understanding dated December 9, 2019, and executed by FHWA and TxDOT.

Appendices

1.0 Background Information

The Texas Department of Transportation (TxDOT) Austin District is proposing improvements to Interstate Highway 35 (I-35) from US Highway 290 East (US 290E) to State Highway 71 (SH 71)/Ben White Boulevard (CSJ: 0015-13-388). See **Appendix A** for a Project Location Map.

Projects Subject to a Quantitative MSAT Analysis

Projects may be subject to a quantitative mobile source air toxics (MSAT) analysis if the project is adding capacity, the design year annual average daily traffic (AADT) is over 140,000 vehicles per day (vpd), there is public concern over air quality, or the project will affect an intermodal facility. Since the project would add capacity and the design year traffic volume is above 140,000 vpd, a quantitative MSAT is required to assess the level at which MSAT would increase or decrease as a result of this project.

The MSAT analysis methodology, including determining and approving the analysis years, the networks links to be included, and the sources for the traffic data used in the analysis, was coordinated via a conference call on April 30, 2021. The call participants consisted of representatives from TxDOT Environmental Affairs Division (ENV), TxDOT Austin District, and the consultant team. After the initial conference call, the estimated time of completion (ETC) for the project was changed from 2030 to 2032; therefore, it was determined via email correspondence that the interim scenario year should be adjusted to 2032. See **Appendix B** for a record of the meeting and subsequent coordination.

2.0 Qualitative MSAT Analysis

Background

Controlling air toxic emissions became a national priority with the passage of the Clean Air Act Amendments (CAAA) of 1990, whereby Congress mandated that the Environmental Protection Agency (EPA) regulate 188 air toxics, also known as hazardous air pollutants. The EPA has assessed this expansive list in their latest rule on the Control of Hazardous Air Pollutants from Mobile Sources (Federal Register, Vol. 72, No. 37, page 8430, February 26, 2007), and identified a group of 93 compounds emitted from mobile sources that are listed in their Integrated Risk Information System (IRIS)[1]. In addition, EPA identified nine compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers from their 2011 National Air Toxics

[1] http://www.epa.gov/iris/

Assessment (NATA)[2]. These are 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (DPM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter (POM). While the Federal Highway Administration (FHWA) considers these the priority MSAT, the list is subject to change and may be adjusted in consideration of future EPA rules.

Motor Vehicle Emissions Simulator (MOVES)

According to EPA, MOVES3 is a major revision to MOVES2014 and improves upon it in many respects. MOVES3 includes new data, new emissions standards, and new functional improvements and features. It incorporates substantial new data for emissions, fleet, and activity developed since the release of MOVES2014. These new emissions data are for light- and heavy-duty vehicles, exhaust and evaporative emissions, and fuel effects. MOVES3 also adds updated vehicle sales, population, age distribution, and vehicle miles travelled (VMT) data. In the November 2020 EPA issued MOVES3 Mobile Source Emissions Model Questions and Answers[3] EPA states that for on-road emissions, MOVES3 updated heavy-duty (HD) diesel and compressed natural gas (CNG) emission running rates and updated HD gasoline emission rates. They updated light-duty (LD) emission rates for hydrocarbon (HC), carbon monoxide (CO) and nitrogen oxide (NOx) and updated light-duty (LD) particulate matter rates, incorporating new data on Gasoline Direct Injection (GDI) vehicles.

Using EPA's MOVES3 model, as shown in **Figure 1**, FHWA estimates that even if VMT increases by 31 percent from 2020 to 2060 as forecast, a combined reduction of 76 percent in the total annual emissions for the priority MSAT is projected for the same time period.

Diesel PM is the dominant component of MSAT emissions, making up 36 to 56 percent of all priority MSAT pollutants by mass, depending on calendar year. Users of MOVES3 will notice some differences in emissions compared with MOVES2014. MOVES3 is based on updated data on some emissions and pollutant processes compared to MOVES2014, and also reflects the latest Federal emissions standards in place at the time of its release. In addition, MOVES3 emissions forecasts are based on slightly higher VMT projections than MOVES2014, consistent with nationwide VMT trends.

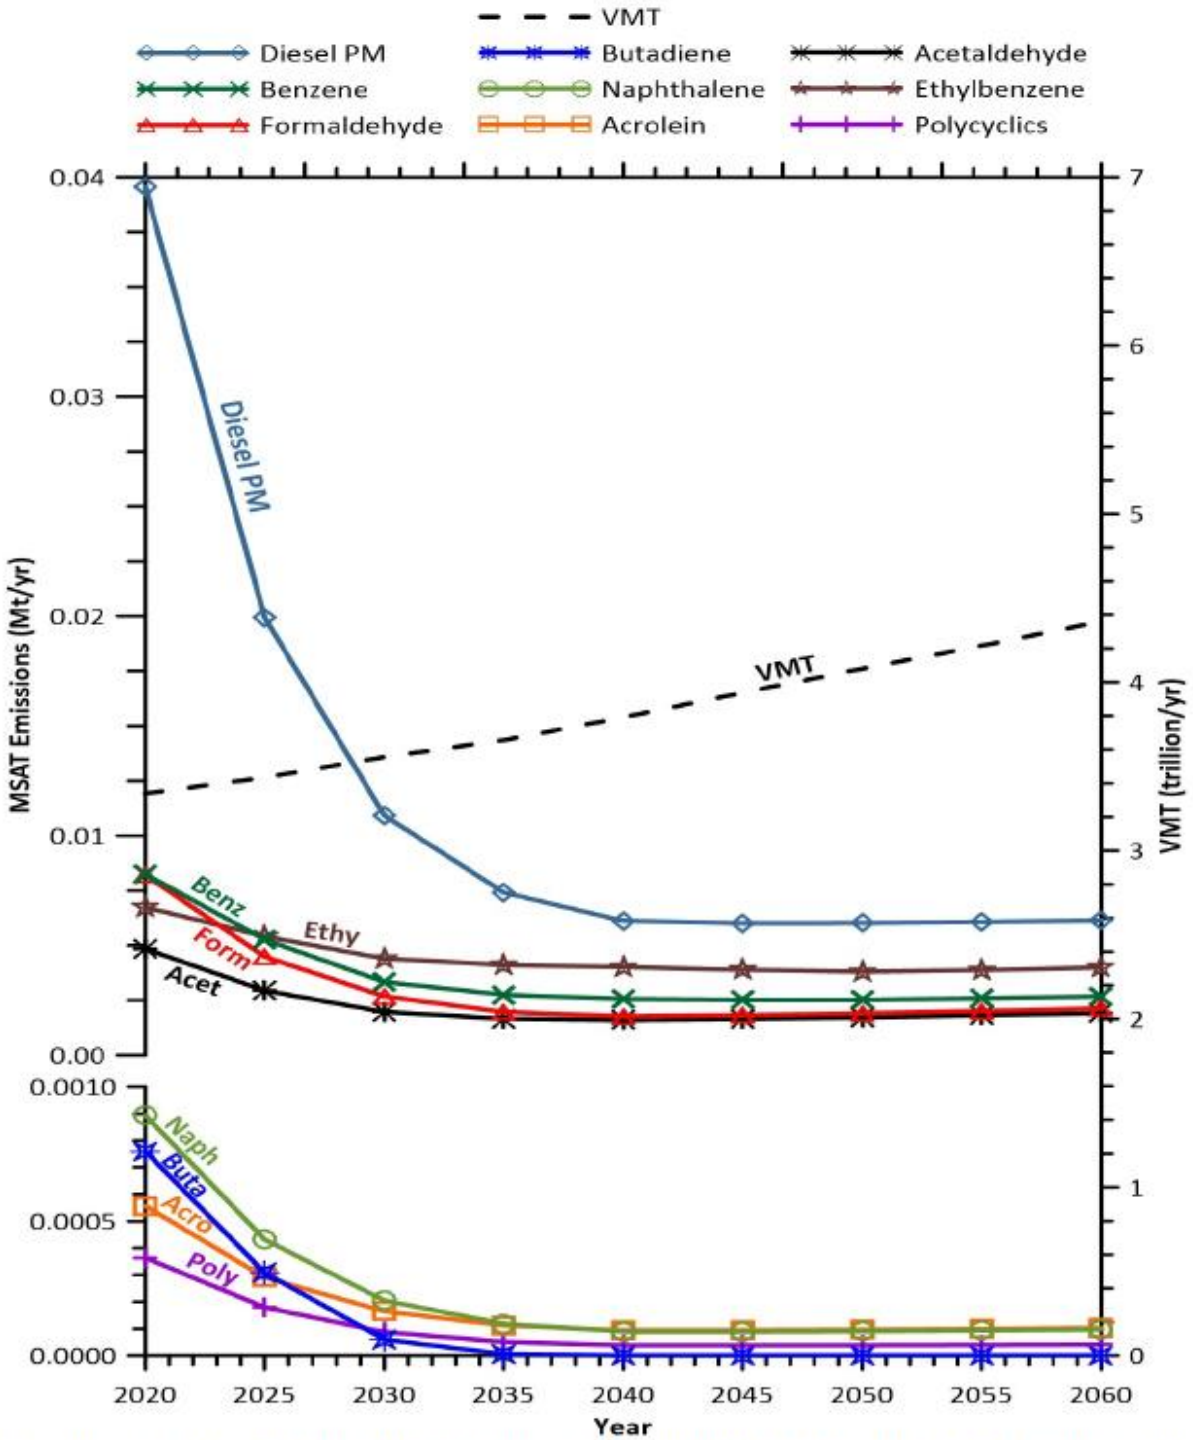
Figure 1: Projected National MSAT Emissions Trends
For Vehicles Operating on Roadways (2020–2060)



Note: Trends for specific locations may be different, depending on locally derived information representing vehicle-miles travelled, vehicle speeds, vehicle mix, fuels, emission control programs, meteorology, and other factors.

Source: EPA MOVES3 model runs conducted by FHWA, March 2021.

MSAT Research

Air toxics analysis is a continuing area of research. While much work has been done to assess the overall health risk of air toxics, many questions remain unanswered. In particular, the tools and techniques for assessing project-specific health outcomes as a result of lifetime MSAT exposure remain limited. These limitations impede the ability to evaluate how potential public health risks posed by MSAT exposure should be factored into project-level decision-making within the context of NEPA.

Project-Specific MSAT Information

A qualitative analysis provides a basis for identifying and comparing the potential differences among MSAT emissions, if any, from the various alternatives. The qualitative assessment presented below is derived in part from a study conducted by FHWA entitled A Methodology for Evaluating Mobile Source Air Toxic Emissions Among Transportation Project Alternatives[4].

For each alternative, the amount of MSAT emitted would be proportional to the vehicle miles traveled, or VMT, assuming that other variables such as fleet mix are the same for each alternative. The VMT estimated for the Build Alternative is slightly higher than that for the No Build Alternative, because the additional capacity increases the efficiency of the roadway and attracts rerouted trips from elsewhere in the transportation network. The emissions increase from the additional VMT is offset somewhat by lower MSAT emission rates due to increased speeds; according to the EPA's MOVES3 model, emissions of all of the priority MSAT decrease as speed increases. The additional travel lanes contemplated as part of the project alternatives will have the effect of moving some traffic closer to nearby homes, schools, and businesses; therefore, under each alternative there may be localized areas where ambient concentrations of MSAT could be higher under the Build Alternative than the No Build Alternative. The localized increases in MSAT concentrations would likely be most pronounced along the expanded roadway sections that would be built between Dean Keaton Street and Manor Road, and between 15th Street and Cesar Chavez Street. However, the magnitude and the duration of these potential increases compared to the No Build alternative cannot be reliably quantified due to incomplete or unavailable information in forecasting project-specific MSAT health impacts. Also, MSAT will be lower in other locations when traffic shifts away from them; therefore, on a regional basis, EPA's vehicle and fuel regulations, coupled with fleet turnover, will over time cause substantial reductions that, in almost all cases, will cause region- wide MSAT levels to be significantly lower than today.

Incomplete or Unavailable Information for Project-Specific MSAT Health Impacts Analysis

In FHWA's view, information is incomplete or unavailable to credibly predict the project-specific health impacts due to changes in MSAT emissions associated with a proposed set of highway alternatives. The outcome of such an assessment, adverse or not, would be influenced more by the uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action.

The EPA is responsible for protecting the public health and welfare from any known or anticipated effect of an air pollutant. They are the lead authority for administering the Clean Air Act and its amendments and have specific statutory obligations with respect to hazardous air pollutants and MSAT. The EPA is in the continual process of assessing human health effects, exposures, and risks posed by air pollutants. They maintain the Integrated Risk Information System (IRIS), which is "a compilation of electronic reports on specific substances found in the environment and their potential to cause human health effects"[5]. Each report contains assessments of non-cancerous and cancerous effects for individual compounds and quantitative estimates of risk levels from lifetime oral and inhalation exposures with uncertainty spanning perhaps an order of magnitude.

Other organizations are also active in the research and analyses of the human health effects of MSAT, including the Health Effects Institute (HEI). A number of HEI studies are summarized in Appendix D of FHWA's Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents[6]. Among the adverse health effects linked to MSAT compounds at high exposures are; cancer in humans in occupational settings; cancer in animals; and irritation to the respiratory tract, including the exacerbation of asthma. Less obvious is the adverse human health effects of MSAT compounds at current environmental concentrations[7] or in the future as vehicle emissions substantially decrease.

The methodologies for forecasting health impacts include emissions modeling; dispersion modeling; exposure modeling; and then final determination of health impacts – each step in the process building on the model predictions obtained in the previous step. All are encumbered by technical shortcomings

[5] EPA, http://www.epa.gov/iris/
[6] http://www.fhwa.dot.gov/environment/air_quality/air_toxics/policy_and_guidance/msat/index.cfm
[7] HEI Special Report 16, https://www.healtheffects.org/publication/mobile-source-air-toxics-critical-review-literatureexposure-and-health-effects

or uncertain science that prevents a more complete differentiation of the MSAT health impacts among a set of project alternatives. These difficulties are magnified for lifetime (i.e., 70 year) assessments, particularly because unsupportable assumptions would have to be made regarding changes in travel patterns and vehicle technology (which affects emissions rates) over that time frame, since such information is unavailable. It is particularly difficult to reliably forecast 70-year lifetime MSAT concentrations and exposure near roadways; to determine the portion of time that people are actually exposed at a specific location; and to establish the extent attributable to a proposed action, especially given that some of the information needed is unavailable.

There are considerable uncertainties associated with the existing estimates of toxicity of the various MSAT, because of factors such as low-dose extrapolation and translation of occupational exposure data to the general population, a concern expressed by HEI[8]. As a result, there is no national consensus on air dose-response values assumed to protect the public health and welfare for MSAT compounds, and in particular for diesel PM. The EPA states that with respect to diesel engine exhaust, "[t]he absence of adequate data to develop a sufficiently confident dose-response relationship from the epidemiologic studies has prevented the estimation of inhalation carcinogenic risk[9]."

There is also the lack of a national consensus on an acceptable level of risk. The current context is the process used by the EPA as provided by the Clean Air Act to determine whether more stringent controls are required in order to provide an ample margin of safety to protect public health or to prevent an adverse environmental effect for industrial sources subject to the maximum achievable control technology standards, such as benzene emissions from refineries. The decision framework is a twostep process. The first step requires EPA to determine an "acceptable" level of risk due to emissions from a source, which is generally no greater than approximately 100 in a million. Additional factors are considered in the second step, the goal of which is to maximize the number of people with risks less than 1 in a million due to emissions from a source. The results of this statutory two-step process do not guarantee that cancer risks from exposure to air toxics are less than 1 in a million; in some cases, the residual risk determination could result in maximum individual cancer risks that are as high as approximately 100 in a million. In a June 2008 decision, the U.S. Court of Appeals for the District of Columbia Circuit upheld EPA's approach to addressing risk in its two-step decision

[8]Special Report 16, https://www.healtheffects.org/publication/mobile-source-air-toxics-critical-review-literatureexposure-and-health-effects

framework. Information is incomplete or unavailable to establish that even the largest of highway projects would result in levels of risk greater than deemed acceptable[10].

3.0 Analysis Methodology

The approach used in the analysis of MSATs along the project area considers the on-road sources for the nine priority MSATs in five different scenarios: Existing Conditions/Base (2023), Interim No Build (2032) and Build (2050), and Design No Build (2032) and Build (2050).

A project links method was used for the analysis. The managed lanes, general purpose lanes, collector-distributors, frontage roads, and ramps within the project were represented as links in the analysis, with a distinct traffic volume, length, and speed for each scenario. Each project link's length was multiplied by the corresponding DHV to obtain a VMT for link. The VMT for each link was then multiplied by an emission rate for each of the nine priority MSATs for a total in each scenario.

Variable emission rates were used in the analysis based on a combination of non-peak free-flow speeds, ranging from 35 to 60 mph, and worst-case peak period speeds, ranging from 3 to 67 mph. The rates were derived from the TxDOT Running Emission Rates Lookup Table (ERLT) for MSAT (*TxDOT Air Quality Toolkit, January 2023*) for the Austin region, which are based on the MOVES3 emission model for each of the priority MSATs for the corresponding analysis years and associated roadway link parameters.

4.0 Analysis Results

The resulting emission inventory for the nine priority MSATs for the project link network is summarized in **Table 1** and **Figures 2** and **3**. The analysis indicates that a decrease in MSAT emissions can be expected for both the Build and No Build Alternatives in 2050, compared to the existing year of 2023. Under the Build Alternative, emissions of total MSAT are predicted to decrease by 51% from 2023 to 2050, even though VMT is expected to rise by 40%. Compared to the No-Build 2032 and 2050 scenarios, the Build Alternative emissions of total MSAT are predicted to increase by 12 and 9 percent, respectively, with VMT increasing by 1 percent and 0.4 percent, respectively.

[10] https://www.cadc.uscourts.gov/internet/opinions.nsf/284E23FFE079CD59852578000050C9DA/$file/07-1053-1120274.pdf

All nine MSAT compounds are expected to decrease from the base scenario in both the Build and No-Build scenarios. Of the nine priority MSAT compounds, DPM contributes the most to the emissions total for all scenarios, followed by benzene. In future years, the difference in No-Build and Build DPM emissions is predicted to decrease, with a calculated 9 percent difference in 2032 and 8 percent difference in 2050.

Table 1: MSAT Emission Inventory by Scenario (2023, 2032, and 2050)

Compound	Year/Scenario					Percent Change by Year/Scenario			
	2023 Base	2032 Interim		2050 Design		Base No-Build / Interim Build	Base No-Build / Design Build	Interim No-Build / Build	Design No-Build / Build
	No-Build	No-Build	Build	No-Build	Build				
Benzene	0.93502	0.45697	0.51596	0.53534	0.57625	-45%	-38%	13%	8%
Napthalene	0.09444	0.02341	0.02637	0.02087	0.02238	-72%	-76%	13%	7%
Butadiene	0.05403	0.00143	0.00167	0.00	0.00	-97%	-100%	17%	0%
Formaldehyde	0.92953	0.28794	0.33079	0.30708	0.33586	-64%	-64%	15%	9%
Acetaldehyde	0.59211	0.25521	0.29817	0.33205	0.36785	-50%	-38%	17%	11%

Total VMT (Miles/Year)	780,848,847	884,570,721	894,016,004	1,089,574,405	1,093,990,268	14%	40%	1%	0.4%

Figure 2: Projected MSAT Emissions vs. VMT by Scenario

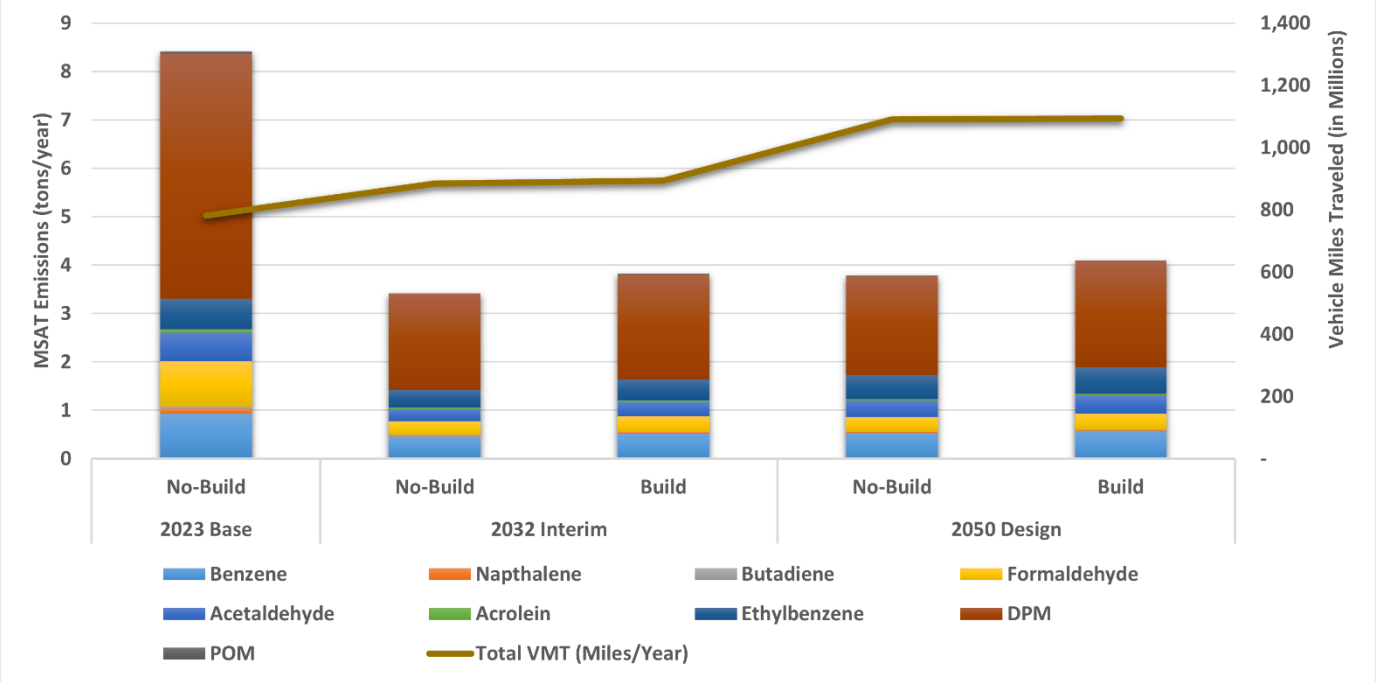

Figure 3: Comparison of Total MSAT Emissions vs. VMT by Scenario

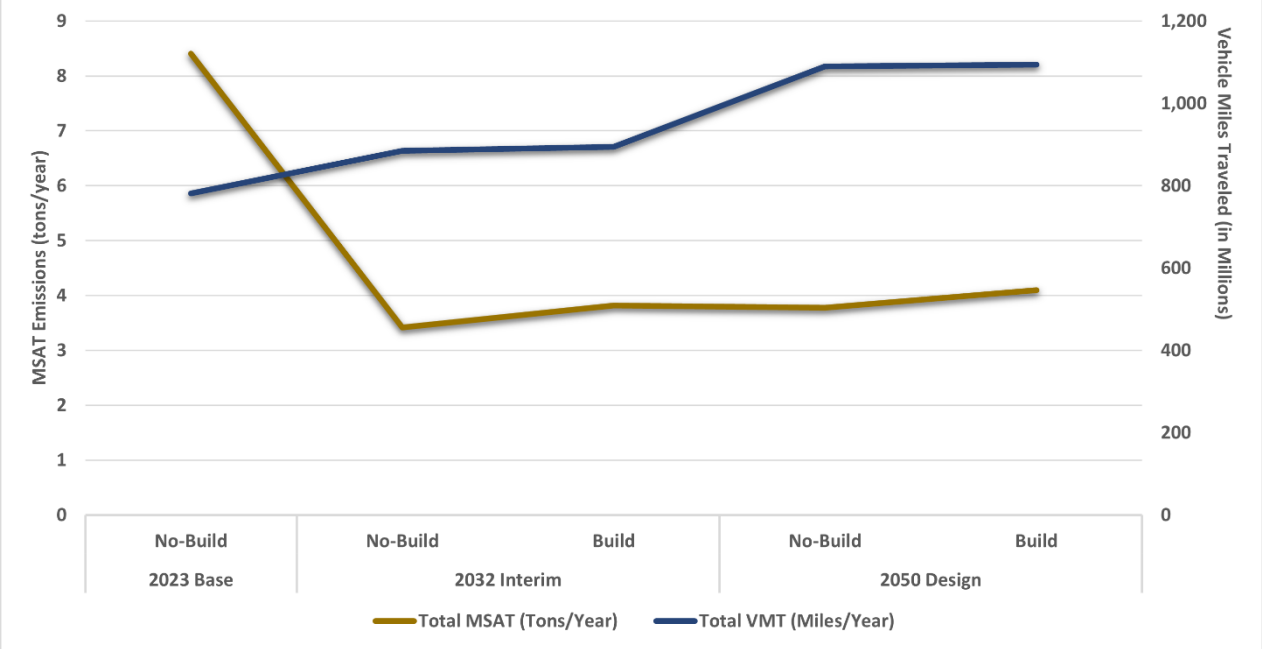

5.0 Conclusion

In sum, both the Build and No Build Alternative in the design year are expected to be associated with lower levels of MSAT emissions compared to the base year. There is a minor increase in MSAT emissions expected between the No Build and Build Alternatives for the design year. Under all alternatives, MSAT levels are likely to decrease over time due to nationally mandated cleaner vehicles and fuels.

APPENDIX B
MSAT Conference Call Meeting Minutes

Quantitative MSAT and CO TAQA Discussion
CapEx Central from US 290E to SH 71
0015-13-388

Date: April 30, 2021 **Facilitator:** Shane Valentine, P.G.

Time: 10:00 am

Location: Microsoft Teams

Purpose: Quantitative MSAT and CO TAQA Discussion

Agenda:

1. **Introductions**
2. **Overview**
    a. Project Description
        i. Capital Express Central (I-35 from US 290E to SH 71/US 290W)
        ii. Project Description – highlight tunnels
    b. Reason for Call
        i. To discuss the years of analysis and methodology required for MSAT and CO TAQA. The project is added capacity and has AADT > 140,000.
            1. Project will require MSAT and CO analysis.
                a. MSAT – Tunnels don't matter. Will be measuring total emissions not doing dispersion modeling.
                b. CO – may need to analyze worst case scenario and measure areas at tunnel exits on either end. Likely use CAL3QHC model and load all traffic onto tunnel exits.
                    i. CPY provided example from Seattle using AERMOD. May use receptors at window locations or air intake ducts at some sensitive receptors. TW – receptors should be at ROW line for even greater sensitivity.
                    ii. Model could incorporate ventilation fans.
                    iii. For analysis we need to assume where ventilation shafts could be installed.
    c. Anticipated Environmental Approval
        i. Anticipated environmental clearance date: **Summer 2023**
        ii. Base year: **2021**
        iii. The estimated time to completion (ETC) year: **2030**
            1. (ETC refers to the conclusion of construction and the opening year of the project.)
            2. Design/Horizon Year: **2050**

a. Design year of 2050 chosen based on the traffic study

d. Timing / Alternatives /Technical Reports
   i. All build alternatives vs. only preferred alternative
      1. We will model all 3 build alternatives for both the ETC and Design Year for the CO analysis
         a. Tim Wood also recommending modeling a No-Build for both the ETC and Design Year
      2. We will only model the preferred alternative for the quantitative MSAT
   ii. Approach - EIS Chapter vs. technical reports-
      1. TW sees no issues but would recommend that the technical analysis be appended rather than put in the EIS document.
      2. Toolkit templates would be appended. Narrative results and summation data table would be provided in EIS.
         a. Further discussions

e. Traffic Data
   i. Discuss traffic data available/in development
      1. Matt Best discussed the microsimulation study that is being conducted for the years of 2030 and 2050
      2. The methodology is being approved by TPP, but not the actual numbers – so traffic data developed using this methodology for any scenario will be acceptable to use once approved by TPP
   ii. Specific traffic data needs for air quality analysis:
      1. No-Build/Existing conditions line diagram with ADT for specified base year
         a. Instead of the corridor-wide 2018 line diagram that was used for the noise analysis and for CapEx North and South, the updated microsimulation study for the base/existing year for 2019 will be used and the numbers grown to 2021.This is to be used instead because of the availability of congested/peak period speeds.
         b. Need 2050 numbers for no-build design year.
      2. Build conditions line diagram with ADT for specified ETC and design year
         a. Data Needed:
            i. Line Diagrams for the 3 Build Alternatives for the years 2030 and 2050
            ii. Congested/peak period speeds for the 3 Build Alternatives for the years 2030 and 2050

1. A table detailing the average speed between major intersections is sufficient

b. MSAT largely the same for all build alts.
   i. No-build qualitative MSAT and quantitative CO
   ii. For DEIS Build alts we will provide qualitative MSAT and quantitative CO analysis.
      1. Provide Quantitative MSAT for **preferred** alternative in DEIS.

c. CO analysis needs to evaluate all build alts.

d. TPP will approve methodology for 2030 (CO) and 2050 (MSAT & CO).

3. Peak period/congested speeds
   a. Will be provided by Traffic team.
      i. Mainlanes, managed lanes, and frontage roads.

3. **MSAT Analysis**
   a. Analysis Years
      i. Base year: 2021 – (traffic data for 2019 will be grown to 2021)
      ii. Design/horizon year: 2050
      iii. Interim year (if applicable): 2030
   b. Methodology
      i. Project Links analysis – only the linework for the project will be included in the analysis
      ii. Speed data – discuss availability of congested speed data in AM/PM for use in the analysis
         1. Availability of this data for all roadways in the project (mainlanes, frontage roads, etc.)
   c. Emission Rates
      i. Utilize the MSAT ERLT in the TxDOT Air Quality Toolkit
         1. New emission rate tables to be provided with data out to 2050.

4. **CO TAQA**
   a. Analysis Years
      i. ETC year: 2030
      ii. The design/horizon year: 2050
   b. Methodology
      i. Use CAL3QHC model for analysis
         1. For tunnel segments, will load traffic data at entrance and exit points and place a receptor
            a. Will also place a receptor at ventilation points

ii. Will consider doing additional intersection analysis if there are determined to be any intersections with a LOS of DEF as a result of the project segments to model
    1. Will model all 3 Build Alternatives
        a. Specific segments will be determined based on ROW width and high ADT, as well as traffic sections and location of tunnel entrances, exits, and ventilation points
    2. Will also model No-Build Alternatives for 2030

c. Emission Rates
    i. Utilize the updated CO ERLT in the TxDOT Air Quality Toolkit

d. Special Considerations
    i. Deck Plaza – currently trying to stay below ventilation threshold -
    ii. Tunnels

5. **Schedule –**
    a. When will traffic data be available:
        i. ADTs – within next week.
        ii. Existing speeds will require re-run of models – possibly deliver next week.
        iii. Congested speeds for no-build and build – trying for end of May.
        iv. TPP approved volumes for all alternatives build and no-build – Likely beyond May.
6. **Data Needs for AQ Team:**
    a. Design DGNs for all 3 Build Alternatives
        i. Existing and proposed ROW
        ii. Lane striping and pavement
        iii. Tunnel configuration – including ventilation, once available
    b. Traffic Data:
        i. Line Diagrams with ADT for all 3 Build Alternatives – for the years of 2030 and 2050
        ii. Line Diagrams with ADT for existing, no-build facility for the year of 2019 (we will grow the numbers to 2021)
        iii. Line Diagrams with ADT for No-Build facility for the years or 2030 and 2050
        iv. Congested/peak period speeds for the 3 Build Alternatives for the years 2030 and 2050
            1. Needed for the full facility (MLs, FRs, DCs, CDs)
            2. A table detailing the average speed between major intersections is sufficient
        v. Intersection analysis showing the LOS for each intersection of the project
            1. Need to ID any intersections with a LOS of DEF because of the project

Action Item Summary (Previous Meeting)

Item:	**Responsibility:**
CPY to send Tim Wood the Seattle AQ analysis study.	Angela Gillmeister
Updated ERLTs with data out to 2050 provided to HDR team	Tim Wood

Carbon Monoxide Traffic Air Quality Analysis – as Published in the DEIS, January 5, 2023

Carbon Monoxide Traffic Air Quality Analysis

I-35 Capital Express Central Project

Travis County, Texas
Austin District
CSJ: 0015-13-388

August 2022

The environmental review, consultation, and other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by TxDOT pursuant to 23 U.S.C. 327 and a Memorandum of Understanding dated December 9, 2019, and executed by FHWA and TxDOT.

List of Tables

Appendices

1.0 Introduction

The Texas Department of Transportation (TxDOT) Austin District is proposing improvements to Interstate Highway 35 (I-35) from US Highway 290 East (US 290E) to State Highway 71 (SH 71)/Ben White Boulevard (CSJ: 0015-13-388). See **Appendix A** for a Project Location Map.

Modeled Scenarios

The project is evaluating improvements between two potential build alternatives, referred to as Build Alternative 2 (Alt 2) and Modified Build Alternative 3 (Alt 3 Mod). Alt 2, Alt 3 Mod, and the No Build Alternative were modeled for this carbon monoxide (CO) analysis for the estimated time of completion (ETC) year (2030) and design year (2050), in accordance with TxDOT's *Environmental Guide: Volume 2 Activity Instructions (September 2021).*

2.0 Background Information

CO is a primary pollutant from motor vehicles that is largely emitted from a vehicle's exhaust system; thus, there is a federal requirement to model localized CO concentrations for proposed highway projects. Projects that are adding capacity may result in an increase of CO emissions; therefore, TxDOT requires the completion of a project-level CO analysis for added capacity projects that exceed an annual average daily traffic (AADT) volume of 140,000 vehicles per day (vpd).

Since the project would add capacity and the design year traffic volume is above 140,000 vpd (see **Table 1** below), a CO traffic air quality analysis (TAQA) is required to assess whether the project would adversely affect local air quality by contributing to CO levels that exceed the 1-hour or 8-hour CO National Ambient Air Quality Standard (NAAQS).

3.0 Analysis Methodology

CO concentrations for the No Build Alternative, Alt 2, and Alt 3 Mod were modeled for the ETC and design years using the CAL3QHC dispersion model. The supplied traffic data includes 24-hour average annual volumes for the years of 2030 and 2050. Traffic for the ETC and design year is shown by section in **Table 1**. See **Appendix B** for the complete traffic data provided by TxDOT Austin District.

Table 1: Projected AADT and DHV

DHV – Design Hourly Volume

The CO analysis includes modeled free-flow areas, as well as select intersections. The free-flow segments (segments 1 through 4) modeled in the CO analysis were chosen based on the areas of the project with the highest AADT and a narrow ROW. Each of the segments were modeled for both alternatives in both the ETC and design year. The modeled segment limits and their respective traffic sections are as follows:

- Segment 1: South of 51st St to N of Airport Blvd (within Traffic Section 2 (Mainlanes) and Section 6 (Frontage Roads))
- Segment 2: North of Dean Keeton to Manor Rd (within Traffic Section 1 (Mainlanes) and Section 4 (Frontage Roads))
- Segment 3: Holly St to north of Lake Austin Dr (within Traffic Section 1 (Mainlanes) and Section 4 (Frontage Roads))
- Segment 4: Woodward St to south of Oltorf St (within Traffic Section 1 (Mainlanes) and Section 3 (Frontage Roads))

Intersection segments (segments 5 through 6) were modeled and chosen based on their Level of Service (LOS) rating (either D, E, or F, with F being the worst LOS). LOS for all the intersections within the Alt 2 and Alt 3 Mod study area were identified for the ETC and design year, as well as AM and PM peak periods. From this,

the two intersections with the most prevalent "F" rated LOS across the peak periods and analyzed years were chosen as the segments for this CO analysis.

- Segment 5: 7th St Intersection (within Traffic Section 1 (Mainlanes) and Section 4 (Frontage Roads)).
- Segment 6: Riverside Dr Intersection (within Traffic Section 1 (Mainlanes) and Section 4 (Frontage Roads))

Background CO concentrations of 1.6 parts per million (ppm) (1-hour) and 1.3 ppm (8-hour) were used for the model in accordance with Appendix B of TxDOT's *Environmental Guide: Volume 2 Activity Instructions (September 2021)*.

Variable emission rates were used in the analysis based on worst-case peak speeds. Worst-case peak traffic speeds range from 3 to 67 mph for both free-flow and intersection scenarios. The rates were derived from the MOVES2014 model, gathered from the TxDOT Running and Idling Emission Rates Lookup Tables (ERLT) for TAQA (*TxDOT Air Quality Toolkit, May 2021*). Running emissions were used for free-flow road links and idling emissions were used for the intersection idling road links.

The following adverse meteorological conditions are the worst-case assumptions and input parameters used in the analysis, in accordance with Appendix D of TxDOT's *Environmental Guide: Volume 2 Activity Instructions (July 2021):*

- Averaging time of 60 minutes
- Atmospheric Stability Class of 4 (stable)
- Mixing height of 1,000 meters
- Wind speed of 1 meter per second
- Winds blowing parallel to the roadway

The following input parameters were used in the intersection analysis, in accordance with *User's Guide to CAL3QHC Version 2.0: A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections (Revised):*

- Average total signal cycle length
- Average red total signal cycle length
- Clearance lost time
- Approach volume on queue link
- Idle emission factor

- Saturation flow rate
- Signal type
- Arrival rate

4.0 Receptor Locations

Free-flow receptors were modeled on the ROW line for each modeled segment. Intersection receptors were modeled at least 10 feet away from the nearest travel lane and on public use features, such as a sidewalk, and placed at each quadrant of the intersection. A standard height of 5.9 feet was given to the receptors for all models to simulate the average height of a person. **Table 2** and **Table 3** depict the associated ROW, LOS, and traffic at each of the modeled receptors. Aerial maps depicting the receptor locations along the project ROW are found in **Appendix C**.

Table 2: Free-flow Receptor Descriptions

5.0 Analysis Results

The 1-hour CO NAAQS is 35 ppm, while the 8-hour NAAQS is 9 ppm, which are not to be exceeded more than once in a year. Modeling results indicate that local concentrations of CO are not expected to exceed national standards at any time along any segment of the project. While emission rates are expected to decrease over time, some model results show a slight increase in CO concentrations from 2030 to 2050. These increases can be explained with the worsening traffic speeds predicted for 2050.

The highest CO concentration result and percent of the 1-hour and 8-hour NAAQS along the I-35 project for all scenarios and intersections are recorded in **Tables 4 through 7**. The highest modeled CO concentrations consistently occur in Segment 2, from north of Dean Keaton to Manor Road, and represents the worst-case results for the project. Though the AADT for Segment 2 is the lowest, it has the slowest speeds and narrowest ROW by 120 feet. In contrast, the lowest modeled CO concentrations occur in Segments 1 and 4, which have the widest ROW.

The projected CO concentrations are relatively consistent between the 7th St and Riverside intersections, with the highest CO concentration result occurring at 7th Street in the Alt 3 Mod 2050 scenario. Results showed that neither 2030 nor 2050 CO concentrations at the worst ranking LOS intersections for the project (peaking

at 2.0 ppm) do not surpass the free-flow segment CO concentrations for any of the build alternatives (peaking at 2.3 ppm).

Among all modeled segments, receptor proximity to roadway section tends to be a standout determining factor for CO concentrations. Peak speed limit is the obvious contributing factor for any variance in expected CO concentrations between ETC and Design scenarios since they vary with year while AADT between the scenarios grow in tandem.

The associated input and output CAL3QHC files have been submitted with this technical report for inclusion in the project files.
